No. 2619

UNIVERSITY PRESS

225 FIFTH AVENUE, NEW YORK CITY 209 ELM STREET, NEW HAVEN, CONN.

CRITICAL ESSAYS OF THE EIGH-TEENTH CENTURY, 1700-1725

Edited, with an Introduction and Notes, by WILLARD H. DURHAM, Ph.D., Instructor in English, Sheffield Scientific School, Yale University.

Dr. Durham has assembled a number of rare critical essays from their remote selves and has grouped them in the present volume, with enough of those better known to represent fairly the various types of English critical thought current at that time. 8vo. Cloth binding. Gilt top. 445 pp. Index. \$1.75 net.

A MANUAL OF THE WRITINGS IN MIDDLE ENGLISH, 1050-1400

By JOHN EDWIN WELLS, M.L., M.A.
Professor of English, Beloit College. (Connecticut Academy Publication.)

"The work is not a history, but a handbook. It seeks to record the generally or commonly accepted views of scholars on the pertinent matters."—From the Author's Proface.

(In preparation.)

A BIBLIOGRAPHY OF MEDIEVAL FRENCH LITERATURE FOR COLLEGE LIBRARIES. By LUCIEN FOULET

Edited by Albert Schinz, Ph.D., and George H. Underwood, Ph.D., Department of French Language and Literature, Smith College.

A list of books essential to an adequate library of medieval literature originally prepared for Smith College by M. Lucien Foulet, which preved of such value that arrangements were made for its publication in such a form as to be of service to other college libraries and to students of medieval literature.

12mo. 80 pp. Paper binding, 25c. net; board binding, 40c. net.

THE COLLEGE CHAUCER

Edited, with Notes and Glossary, by Henry Noble Mac-Cracken, Ph.D., President of Vassar College.

"The best edition for all ordinary purposes."—A. L. A. Booklist. (Second Printing.) 12mo. Cloth binding. 713 pp. \$1.50 net.

A SELECTION OF LATIN VERSE NOTES TO A SELECTION OF LATIN VERSE

Edited by Henry D. Wild, George E. Howes, Monroe N. Wemore, John S. Galbraith, and Alfred M. Dame, Instructors in Latin, Williams College.

"The members of the Latin department of Williams College deserve much credit for preparing this attractive little anthology of Latin verse."—The Classical Journal.

16mo. Text, 134 pp. Notes, 63 pp. Text alone, cloth binding, 75c. net; notes alone, cloth binding, 40c. net; notes alone, paper binding, 30c. net; text and notes, cloth binding, \$1.00 net.

SOME TEXTUAL DIFFICULTIES IN SHAKESPEARE

By CHARLES D. STEWART

(Published under the Auspices of the Elizabethan Club of Yale University.)

"Contains the soundest, most sensible, most forcible Shakespearian isdom that has appeared in many years."—The Boston Transcript. 12mo. Cloth binding. 251 pp. Index. Price \$1.35 net.

CICERO OF ARPINUM

A Political and Literary Biography, being a Contribution to the History of Ancient Civilization, and a Guide to the Study of Cicero's Writings.

By ERNEST G. SIHLER, Ph.D

Professor of the Latin Language and Literature, New

York University.

"In this full treatment of the orator and his surroundings, Pro-fessor Sibler has made a valuable contribution to Ciceronian liter-ature."—The Atheraum.

8vo. Cloth binding. 487 pp. Bibliography. Index. \$2.50 net.

CIVILIZATION AND CLIMATE By ELLSWORTH HUNTINGTON, Ph.D.

Author of "The Pulse of Asia."

The author's investigations cover a wide range of human activity as affected by climate—his deductions based on these data are most interesting.

8vo. Cloth binding. Gilt top. 275 pp. Diagrams. Appendix. Index. 32.50 net.

PROBLEMS OF AMERICAN GEOLOGY

By WILLIAM NORTH RICE, FRANK D. ADAMS, ARTHUR P. COLEMAN, CHARLES D. WAL-COTT, WALDEMAR LINDGREN, FREDERICK LESLIE RANSOME, and WILLIAM D. MATTHEW. (Silliman Memorial Lectures.)

"The volume holds an important place in the progress of geology, elucidating and evaluating the principles and relations which coordinate the ever-accumulating mass of detail, and directing the further progress of research which in turn makes more accurate our knowledge of the past."—American Journal of Science.

8vo. Cloth binding. 340 pp. 68 illustrations. Maps. Index. 34.00 net.

THE PROBLEM OF VOLCANISM By JOSEPH P. IDDINGS, Ph.D., Sc.D.

(Silliman Memorial Lectures.) (Silliman Memorial Lectures.)

"It is distinctly a successful achievement, to be unqualifiedly commended to all students of geology in general or of volcanic settivity in particular."—Scientific American.

8vo. Cloth binding. 273 pp. 16 photogravures, 70 halftones. Chart. Index. \$5.00 net.

ECONOMIC ASPECTS OF THE WAR Neutral Rights, Belligerent Claims and American Commerce, in the Years 1914-1915.

By EDWIN J. CLAPP

Professor of Economics, New York University.

This book, the first authoritative work showing the actual effect on this country of the great European struggle, discloses bow international lawlessness affects America, as a type of the neutral nations of the world.

12mo, 368 pp. Index. Appendix. \$1.50 net.

WRITINGS ON AMERICAN HISTORY, 1913

A Bibliography of Books and Articles on United States and Canadian History Published during the Year 1913, with some Memoranda on Other Portions of America. Compiled by Grace Gardner Griffin.

Includes both magazine and book matter, listed under epochs and ographically as well. Imperial 8vo. Cloth binding. 193 pp. Index. \$2.00 net.

HARPER'S BOOKS FOR COLLEGE CLASSES

Source Problems In English History

Prof. ALBERT BEEBE WHITE and Prof. WALLACE NOTESTEIN, of the University of Minnesota. With an introduction by Prof. DANA CARLETON MUNRO, of the University of Wisconsin.

Post 8vo, Cloth, \$1.20 school.

"Among its strong points three especially may be enumerated. The stress is laid upon the development of the English Government. The connection between English institutions and those of New England is brought out. . . The connection between the present and the past is well brought out. . . I am confident that this book is the most valuable aid which has been prepared for the teaching of English history in secondary schools or in elementary college classes."—Prof. Dana Carleton Munbo.

Parallel Source Problems in Mediæval History

By FREDERIC DUNCALF, Adjunct Professor of History, University of Texas, and AUGUST C. KREY, Instructor in History, University of Illinois. With an introduction by Prof. DANA CARLETON MUNRO. \$1.10 school.

A book which has obtained immediate approval and many adoptions. One keen reviewer wrote, "The thorough carrying out of the method will afford critical training such as few students of history, we fear, now get in either school or college." Pronounced the best book on the subject.

Source Problems on the French Revolution

By FRED MORROW FLING, Professor of History, University of
Nebraska, and HELENE DRESSER FLING, M.A. \$1.10 school "The evolution from the memorisation of a text-book to a scientific critical study of historical evidence is well presented in Prof. Filing' Source Problems.' It is laboratory work in history and has the same justification as laboratory work in the natural sciences. It is unquestionably a valuable method of study."

—The Nation.

Party Government in the United States of America

WILLIAM MILLIGAN SLOANE, Seth Low Professor of American History in Columbia University.

Croson 8vo, Cloth, \$2.00 net. "The author's method is primarily, as it abould be, historical. . For a running commentary on the growth of party government in the country written in the large by a student of world history, and therefore involving some detached points of view, and a wealth of allusion likely to be beyond the reach of the narrower specialists in the field, Protessor Sionae's book will probably stand for some time in a class by itself."—The Dist. A Guide to Good English

By ROBERT PALFREY UTTER, Associate Professor of English in Amherst College.

Post 8vo, Cloth, \$1.20 net.

The first part deals with spelling, punctuation, statement, sentence and peragraph structure indexed under the symbols used by instructors in correcting theses. The second part explains methods applied to expository and argumentative writing. The third part treats of presedy and English grammar.

"A vade success which will save the teacher's time, give students needed aid, and prove constantly useful to the general public."

By HERMAN G. JAMES, Associate Professor of Government and Director of the Bureau of Municipal Research at the University of Texas.

12mo, Cloth, 75 cents school, "It is far and away the best work on Municipal Government I have ever read. It combines the theory—the municipal ideal—with a practical draft of provisions for a model city charter in a manner that is really admirable."

WM. Dudley Foulks.

"THE STANDARD AMERICAN HISTORY"

The American Nation: A History by Associated Scholars

Edited by ALBERT BUSHNELL HART, Professor of Government in Harvard University.

27 vols. \$2.00 net per vol.; if bought in groups, \$1.80 per vol. The class use of separate volumes for the study of special periods is constantly increasing, while the complete set is found more and more necessary for every library.

Social and Economic Forces in American History
Net \$1.50

The Odd Number

Stories selected from Guy de Maupassant, with an introduction by Henry James. \$1.00.

Dame Care By HERMAN SUDERMANN.

Ten Tales By FRANCOIS COPPEE.

With an introduction by Brander Matthews, Professor of Dra-matic Literature in Columbia University.

CORRESPONDENCE INVITED. SELECTED LISTS SENT ON REQUEST.

HARPER & BROTHERS, YORK NEW

"Books like these at their prices are a kindness to the public."

CROWELL'S ASTOR POETS

This edition is especially adapted for the schoolroom, the library, and the home. The volumes are not too fine to handle, but will be found well printed and neatly bound. In nearly all instances biographical introductions, complete notes and indices are included, together with a frontispiece portrait of the author. 85 vols. Cloth, 12mo, per vol. \$0.60

"An edition that will be found satisfactory on all points."-Los Angeles Herald.

"Not to be excelled."-School Journal.

"Will meet the wants of every lover of the poets."-Brooklyn Daily Eagle.

"Is highly recommended to students."—Poet Lore.

Oxford University Press American Branch, 35 West 32d St., New York

SOME OF THIS SEASON'S IMPORTANT BOOKS

READINGS IN VOCATIONAL GUIDANCE

By MEYER BLOOMFIELD, Director of the Boston Vocation Bureau.

Into this timely volume are gathered together the most significant magazine articles, addresses, and other published and unpublished contributions to the literature of vocational guidance.

723 pages, \$2.25.

GERMANY SINCE 1740

By GEORGE MADISON PRIEST, of Princeton University.

A brief and well-written study of the development of modern Germany, considered in relation to art, letters, philosophy, and politics. Maps and genealogical and chronological tables add to the usefulness of this clean-cut little book. It tells the story of Germany down to the outbreak of the present war in August, 1914.

199 pages, \$1.25.

THE SCHOLIA ON THE AVES OF ARISTOPHANES

By JOHN WILLIAMS WHITE, of Harvard University.

The body of the book contains a transcript of the text of the play and opposite this, page for page, the scholia with the editor's notes. Preceding this is a one hundred page introduction on the origin, development, transmission, and extant sources of the old Greek commentary. cxii + 378 pages, \$3.50.

READINGS FROM AMERICAN LITERATURE

By MARY EDWARDS CALHOUN and EMMA LENORE MacALARNEY.

An anthology of the best in American prose and verse which will be found especially valuable for the colonial period, in that it reproduces many selections now obtainable only in rare and costly editions.

635 pages, \$1.40.

THE ENGLISH NOVEL BEFORE THE NINETEENTH CENTURY By ANNETTE BROWN HOPKINS and HELEN SARD HUGHES.

This volume contains a collection of long excerpts from eighteen novels arranged chronologically, from Malory's Mort D'Arthur down to Jane Austen. The historical introduction and the bibliography will be found of great assistance to the student.

794 pages, \$1.60.

GEOGRAPHIC INFLUENCES IN OLD TESTAMENT MASTERPIECES

By LAURA H. WILD, of Lake Erie College.

An entirely non-sectarian attempt to interpret the magnificent literature of the Old Testament through the geography of Palestine. It furnishes a vivid picture of that beautiful country.

182 pages, \$1.00.

TYPICAL NEWSPAPER STORIES

By H. F. HARRINGTON

A collection of successful newspaper stories for the inspiration and emulation of young journalists.

Ready this fall.

READINGS IN AMERICAN HISTORY

By DAVID SAVILLE MUZZEY, Barnard College, Columbia University.

This is a source book covering every phase and aspect of the development of America as a nation. The volume contains about 125 extracts. Ready this fall.

GROWTH OF AMERICAN STATE CONSTITUTIONS

By JAMES QUAYLE DEALEY, Brown University.

Part I of this significant book treats of the historical growth of American state constitutions; Part II compares those now in use; Part III, by tracing the trend of the past one hundred and forty years, points out the probable line of change for the future.

308 pages, \$1.40.

TEXTBOOKS AND THE STATE.

The importance of textbooks as an element of our educational system may be gauged from the fact that we spend upon them no less than two-thirds as much as we spend upon chewing-gum. Yet the \$17,000,-000 thus invested is but 2 per cent. of our entire bill for education. For each pupil in the public schools, the cost of books is on the average 78 cents a year. A negligible item! An item, at least, so small in the total budget that the only question likely to arise in connection with it is whether we are getting in our particular school the best books on the market. So one would reason who was guided solely by the figures. The facts are far otherwise. So large does the cost of textbooks appear in the eyes of legislators that they are influenced to take one or both of two lines of action regarding them. One of these is to furnish such books to pupils free. This movement seems to be gradually spreading over the country. Maine, for instance, compels her towns to provide free textbooks, but the local school committee may contract with publishers as to the price for the books sold to parents who wish to pay for them. In Minnesota, the district board may provide free books or sell them at cost. The direction in which this regulation looks is indicated by the further provision that the question of free books must be voted upon, if as few as five persons request such an election.

The other line of action towards which legislators are occasionally influenced by their view of the cost of textbooks is to place the choosing and printing of these books in investment, depreciation of plant, even sal- parents paid for their books twice is suf-

the hands of the State. This movement has never gained great headway, but now and then it appears in a new capital. Alabama is considering this step, as Georgia, Kansas, and California have considered it before her. Two years ago, Georgia appointed a Joint Legislative Commission of eight to investigate the subject. This Commission reported adversely to the project, and the matter was dropped. The same winter, Kansas created a State School-Book Commission, with power, among other things, "to purchase necessary machinery, type, and other printing and binding material, to print and bind school books, to procure copyrights for same, or to contract for the right to publish said school books, on a royalty basis, and to provide for the preparation, publication, purchase, sale, and distribution of a State series of school textbooks at cost, making appropriations therefor." In accordance with this law, a "History of Kansas" was written by a county superintendent, and its crudities were ironed out by one or two professors in a higher educational institution of the State.

But the point upon which stress is always laid is not the quality, editorial or mechanical, of books published by the State, but their low cost. The "History" was sold for 22 cents, a book of literary selections for 18 cents. Did the State come out ahead, or did it not? The answer is that nobody knows. As is usual in balance-sheets of State-made articles, no account is taken of elements of cost that are included in private estimates as a matter of course. A State is above taking notice of "overhead charges." Why should it trouble itself about interest on the

aries, storage, insurance, postage, and so on? Kansas has invested \$230,000 in this venture. The interest on this sum at 6 per cent. would amount to \$13,800 annually. It is obvious that the omission of items like this renders any estimate of cost almost valueless. The one thing certain is that whether she paid more to private publishers than she is paying now, at least she knew how much she paid then, and she does not know now. As the difference at most cannot be more than a few cents on each book, she would appear to be paying dearly for the privilege of making her own whistle. Towards this conclusion, she herself seems to have been driven, for the Legislature of 1915 amended the law in several important respects. It now directs that the Commission shall provide by adoption for such books as they may "find it impossible or impracticable to print or publish." It also abrogates a stupid provision in the law of 1913, which prohibited the use of supplementary books!

The only long trial of the plan has been made by California. For twenty-eight years, from 1885 to 1913, that State actually appropriated money to pay for publishing textbooks-and also charged for the books! It occasionally introduced a variation into this system by making special appropriations for its publishing plant. In 1913 it came to the conclusion that if the State taxed itself for the books, it ought not to have to pay for them a second time, and provided that textbooks should be free. Of this experiment, one thing can be said with confidence: it has cost the State money rather than saved it money. The mere fact that

ficient to establish that. These books were sold at about the prices asked by private publishers for books at retail, and yet the sums thus received by the State were not nearly enough to reimburse it for publishing them. The first set of texts was sold for double the price at which the State Printer had estimated that he could produce it. Now that California has gone the whole length by printing and distributing her textbooks free, she makes her appropriations with a more lavish hand. Up to 1913 the appropriations, direct and indirect, for publishing these books aggregated about \$800,000. In February, 1913, the Legislature appropriated "for the purpose of paying expenses of publishing State textbooks and distributing the same free to the school children of the State" all the money then in the State school-book fund, amounting to \$156,-000. In June it made an additional appropriation of \$500,000 for the same purpose. But unless a radical change in methods of accounting is made, California will still be far from a knowledge of what her school books are costing her.

But the item of expense, large as it looks to the legislator, is in reality the smallest element in the question. What are a few cents, or several cents, when the quality of a textbook is at stake? Yet this element of quality apparently never enters into a State's consideration of the matter. seems to fear that it would be reflecting upon its own educational efficiency if it were to admit that its textbooks ought to be written by outsiders. The instinctive method of procedure is to get hold of a more or less prominent local educator who will not charge too much, and set him to work turning out the volume. No law to this effect need be written on the statute-book; local patriotism will be sufficient. One or two States, nevertheless, that are not doing their own printing, to make assurance doubly sure, have inserted something in their laws to that end. Louisiana definitely instructs her State Textbook Commission to show a preference for Louisiana books in their adoptions. Even if the resort to State printing were not so much a thing of politics, engineered by politicians, administered to too great an extent by politicians, the temptation to exploit local talent in the writing of textbooks would still be strong.

Now, textbooks lie very close to the centre of our system of public education. Teachers lean heavily upon them. They should, therefore, possess two features that only the expert can rightly give them: they

should be authoritative, and they should be teachable. The qualities of scholarship and pedagogical ability are not always united. On the contrary, they are rarely found together. Who is going to seek out the proper person to write a book that must be at once learned and simple, sage and plain? Kansas proposed to manage it by having her Commission select, outside of its own membership, a secretary, who should be a textbook expert as well as the executive officer of the Commission. His salary was not to exceed \$2,000 a year. This was as if a State should make an agreement with a publishing house to buy all of its textbooks from that one house, and to choose a house that did not pay its best textbook expert more than \$2,000 a year. For the sake of saving a few cents on a book, which it might or might not, in the end, save, it surrendered its privilege of selecting from a score of finished volumes, produced by able and experienced concerns, the one best suited to its purposes.

It is not to be denied that private publishers have been somewhat to blame for the itch of State textbook publishing. The competition among them not many years ago was so keen, their methods in some cases were so shady, that not only politicians, but wellmeaning folk, were tempted to ask themselves whether there must not be huge profits in a business that could support such extravagant methods of unloading its product. There is no doubt that now and then bribery was tried, sometimes successfully, by a house too eagerly bent upon getting its books into the schools of a city or a State: on the other hand, a politician would occasionally hint that the privilege of supplying textbooks was one that could be bought, like the textbooks. But one hears little of this sort of thing now. Competition is still keen-too keen to give substance to the idea. prevalent in certain localities, of a "schoolbook Trust"-but ordinarily it is conducted in a way to leave the question of State publication to be decided upon its merits. The general tendency of States to adopt uniform texts may have encouraged in one or two of them the idea of doing their own publishing, since uniform texts mean fewer texts. But this fact points in reality in the opposite direction: a private publisher who receives a contract to supply one or more texts to an entire State for a three or fiveyear period can name a price which takes away the argument of economy, to say nothing of the more important element of

The State-University Idea

By WARNER FITE.

In Eastern newspapers of a more progressive type one hears occasional echoes of that peculiar reverence which is paid in the West to "the State-university idea." At the same time one may detect a growing willingness. not to say eagerness, on the part of Eastern universities for a closer relation to the State. Remembering the resources of the State as a patron of education and the huge appropriations which are sometimes granted to State universities, this willingness is not wholly surprising. But the grounds urged for "the State-university idea" are of a different sort. The State university is supposed to represent the final and logical type of scholastic institution, by the side of which the private, or corporate, university is an inheritance from an unenlightened past, before education came to be regarded as a social function. And in this country the State university is the special representative of "democracy." The picture is drawn of the private institution as administered by the financial interest, the mouths of the professors closed by the fear of disturbing vested interests, while the State university, owing allegiance to none but "society," enjoys a complete freedom.

No comparison could, I believe, be much further from the facts. It is true that our State universities have been on the whole remarkably free from "politics," in the sense of party politics. But no one who remembers how State institutions in general are administered in this country could expect them to be free from more or less corrupting personal influences. I have known of one State university whose policy was absolutely controlled by one member of the board, supposed to be the wealthiest man in the State; so much so that none of his colleagues ventured to suggest a measure without first learning his wishes. It was only by the grace of God that he was indifferent about the educational policy. Another institution might be named which some time ago was granted a large increase of income. A lively public campaign preceded the grant, and it was followed by mutual felicitations. But every one knew that one step alone had been responsible for success: a representative of the university had called upon the political boss of the State, a man known far and wide as an infamous politician, and had been successful in obtaining his favor. This does not mean that any promises of support were given. But one is obliged to wonder how far a member of the faculty of that institution, in his capacity of citizen of the State, will be at liberty to indulge in public condemnation of the politician in question, and how far his position is superior to that of the professor whose salary comes from "tainted" private wealth.

And if the State university is free from party politics, it is not free from the politics of local interest. From the standpoint of the university town, the university is mainly a

source of trade, the town's share in the favors bestowed by the State; the town is therefore interested in the material prosperity of the university. This brings about a community of interest which is scarcely less corrupting than party politics, and which subjects the university to a preponderating influence in its affairs on the part of a local, and not seldom an ignorant, community-for few of the State universities are situated either in the capital or in the largest city of the State. And as for any other community of interest, if we imagine the university suddenly taken up and carried away, like Aladdin's palace, it would often be difficult to determine, from a study of the habits and modes of thought of the townspeople, whether the gap had been filled by the State university, the insane asylum, or the State prison.

Nor are we to imagine that "the Stateuniversity idea" stands for any special immunity from religious prejudice. It has been customary in State universities, no less than in denominational colleges, to question a candidate for appointment concerning his church connections. Any church connection will do. But in the small Western towns a man with no church connection is apt to be looked upon askance, especially if he refuses to apologize for it; and in the town society a family without church connections is considered hardly respectable. This means also that the code of personal morals which the candidate is expected to follow is apt to be somewhat narrowly Puritanical. I recall one State university professor who told me. rather sadly, that while his colleagues in the denominational colleges could drink a glass of beer when so inclined, he himself was obliged to pose as a total-abstainer. To those who are familiar with the history of State universities his story will be not wholly incredible. The State universities have had to face a steady fire from the denominational colleges, which, on grounds purely theoretical, connected with the separation in this country of state and church, have loved to denounce the State university as godless and immoral. The State university is therefore compelled to make a double show of piety and morality.

It would be historically incorrect to say that the State university has been made in Germany. It is a fact, however, that State universities have grown to their present dimensions during a period in which our conceptions of higher education have been dominated by German influences. And there can be little doubt that the German conception of the organized State underlies the thoughts of those who are impressed with the beauty of "the State-university idea." The State university is conceived to be the logical head of the educational system of the State. Ideally, it should consist of a body of educational experts-efficiency-men-who would control the educational system of the State from top to bottom. And not only the public system. They would also formulate the standards to which all private, or corporate, institutions would be obliged to conform. Nor is this all

-indeed, it is a small part. Following "the Wisconsin idea," the object of envious imitation in State-university circles, the university would provide authoritative experts for all departments of life. No laws should be made without consulting them, and nothing would be too trivial or too secular for their attention. In the full realization of "the State-university idea" we should see a State made happy and prosperous by authoritative academic wisdom.

From the standpoint of "social efficiency." the beauty of the idea is perhaps indisputable. But there may still be some Americans who wonder whether social efficiency. so called, is a complete test of social excellence, and whether America free is not more desirable than America efficient. Just at the moment we have a rare opportunity of studying the fruits of social efficiency in Germany, the land where the State-university idea has achieved its finest realization; and where, on the part of university professors, a miraculous uniformity of sentiment (coupled with a devastating diversity of argument) is illustrating for us the ideal of academic freedom. Some time ago the Nation printed an article on the recent difficulties of "the State-university idea" at the University of Wisconsin, in which the writer dwelt somewhat upon the fickleness and stupidity of a character named Demos. I am unfamiliar with the Wisconsin Demos, but from certain expressions of "the Wisconsin idea" in other places, I am led to suspect that Demos found the idea too much for him. Some time before I had had the pleasure of reading a public circular in which another State university, unhappily not provided with a department of dairying, undertook to enumerate the services that could be rendered the State by other departments. Among others, the department of public speaking could assist the State in the discussion of public questions-the department in question consisting of one bachelor of arts of two years' standing. One may hazard the guess that Demos does not wish to be assisted in the discussion of public questions.

Nor is it at all clear that the alliance with Demos is favorable to the higher interests of the university. State universities in this country have not thus far been distinguished either for an atmosphere of culture or for disinterested scientific achievement. And in the appeal to Demos little or nothing is said about the leavening influence of the mere presence in the State of a body of cultivated men. While large sums have been extracted from Demos for the general uses of the university, more or less by a resort to lobbying, the argument has been based chiefly upon corn and cows: and Demos, while paying for corn and cows, has unwittingly contributed to culture. It still remains to be seen how far Demos would approve of the broader aims of the university-for liberal scholarship, for disinterested scientific research, and for the cultivation of the humanities-if these items were specified in the

And if Demos should object, it would be ble which it shares with all of life. "The

hard to say that he would be altogether wrong. If Demos is to pay the bill, why should he not be the chooser of the goods? Now, Demos is by no means a brute. He may be mainly interested in corn and cows, or in trade, but he is always pleased to see his son become a finer and more capable man than himself. He is not quite satisfied, however, that all the apparatus of the State university is necessary to this result. If he forms his idea of the university from the daily press, he will judge that it is primarily occupied with the promotion of athletics and social events. And if he makes a visit to the university, he may be led to think of it as mainly an institution where men of intellectual tastes may pursue their favorite avocations at public expense; or where a set of youths, by no means conspicuously superior in natural ability and taste to their brothers who are working every day and all day in offices and stores, are enjoying independent leisure. Granting that he gives the university full credit for serious intellectual work, he may still be pardoned for wondering how much of it is useful to Demos. It is all very well to tell him that leisure and independence are necessary to culture; that the independent pursuit of culture and learning is an advantage of the State; that these tend ultimately to raise the standard of living to refine the habits and the morals of men, and in the end to add to the general prosperity. This may be evident enough from the point of view of the cultivated man. though even for him it will be more or less an article of faith. Demos inevitably-and one may say, rightfully-looks to more immediate and tangible results.

A sense of the incompatibility between the point of view of Demos and that of the more scholarly aims of the university is bound to have, and does have, a certain benumbing influence upon the policy of the State university. Whatever the ambition of the university in the direction of a liberal as opposed to a practical culture, it is the practical rather than the liberal that must be put forward when dealing with Demos. The inevitable result is that men who are pursuing the more practical studies come to feel that they have a more securely vested interest, while the others may be led to doubt whether they have any right to their places. The professor in the State university is obliged to remember that he is the servant of Demos. As a high-school teacher of history or of science, he might easily satisfy himself that he is giving Demos not only what is good for him, but what he would gladly pay for. As a university professor of higher mathematics, or of Romance literature, or of philosophy, he may have ground for doubting whether Demos would pay the bill if left to himself, if he does not also doubt whether Demos has any real use for the goods.

The truth is that the idea of the State university is not so logical as it seems. Its logical completeness is marred by an internal disharmony between the useful and the no-

State-university idea" assumes that higher culture may be supported by an appeal to common interests. But common interests are inevitably, if not also justifiably, more or less utilitarian; and no argument based upon common interest will ever quite convincingly justify the finer works of the spirit. In the history of culture spiritual advancement has been founded, not upon common needs, but upon a certain freedom from those needs which is to be described generally as "leisure." It may well be that the fruits of leisure include an increase in general prosperity, but no cultivation of the spirit based upon the need of prosperity will yield the ripe fruit. The flight of the spirit presupposes surplus energy, or at least a freedom from common cares. If the imagination of the scholar or of the man of science is to work freely, he must be absolved from any immediate responsibility for tangible "results." And if an institution of learning is to feel free to adopt a liberal programme of thought and of research, it must be supported by surplus wealth. Higher thought and learning are in all senses of the word speculative. So far, then, from discovering any absurdity in the support of higher education by private wealth, as contended by the advocates of "the State-university idea," we may, on the contrary, discern a special fitness in the idea that liberal education should be supported by free contributions and not by a tax upon common needs.

Yet I have no wish to urge that the State university is itself an absurdity. The State university has doubtless come to stay; and in the modern state it is bound to fulfil an increasingly important economic function. Nor is there any reason why it should be bound by economic restrictions as long as Demos is willing to pay the bill. My point is rather that the endoved institution, so far from requiring an apology for its existence, possesses a special advantage. There is no reason why all institutions of learning should be of the same type, have the same curriculum, or conform to the same standards. And it is mere socialistic nonsense to suppose that an institution which lies outside of the political system performs no "social function." The endowed university enjoys an invaluable freedom. Donors may sometimes be exacting, but at length they die, while the Legislature goes on forever. No Legislature can be counted upon to respect academic tradition. The State university is likely at any time to have its income reduced, to be placed under foreign control, or to be subjected to conditions wholly at variance with academic ideals. The endowed university is mistress of her own policy. While not free from public responsibility. she is free to resist popular prejudice. If she will exercise economy and choose her own course, she can in most cases wait for gifts to come to her. As the representative of a truly academic freedom she performs an important social function, and any endowed university seeking the protection of the State is parting with an invaluable birthright.

Hittite Greek

IMPORTANT CORROBORATION OF THE DISCOVERY OF THE GREEK CHARACTER OF HITTITE.

By GEORGE HEMPL.

There have recently come to my knowledge certain texts that throw clear light upon the problem of the affinities of the Hittites, whose empire extended over Asia Minor, Syria, and northern Mesopotamia, and was at the height of its power during the second millennium before Christ. This new evidence is such as will doubtless be appreciated by scholars generally, as well as by philologists. I therefore venture to avail myself of the columns of the Nation in order that I may call attention to the significance of these texts, preliminary to treating them in detail in a professional journal.

Three years ago I succeeded in reading certain Hittite documents. My first report on the subject was made in a paper read before the Philological Society of the Pacific Coast, in November, 1913, and published in the last volume of the "Transactions of the American Philological Association." In this I showed that Hittite was Greek, and that, while the dialect of the early Hittites was Javonian and closely akin to the later Greek of Attica, the Hittite empire was conquered about 1400 B. c. by Dorlans, the official documents of the new dynasty being in a form of Doric. This Doric differs from the Doric hitherto known to us, not only in being much older, but also in having had a long independent development. Like the Doric we already knew, it reveals an accent that stands one mora farther on in the word than that of other Greek; it retains long a. where Javonian Greek has long e: it often shows s for th; it employs such forms as enti for esti, and the pronouns (e) min, (e) tin, sin/hin. On the other hand, it frequently omits pretonic and initial unaccented vowels, and even syllables, thus betraying stress accent; it simplifies st(e)r to s(e)r; it usually drops final -s after a short vowel if no initial vowel follows; it treats final -n similarly, or changes it to the cognate -r: and it has infinitives ending in -wor/-mor and -or, which represent -mon and -on, the gradation mates of Doric men and -en.

When I published my report, the Hittite material which I had at my disposal was limited. Recently I have got access to transcripts of numerous Hittite cuneiform texts and find my earlier conclusions fully confirmed. I have not, however, deceived myself into assuming that the careful interpretation of even a considerable number of Hittite texts would soon convince the philological world of the nature of the language. There are various reasons why this should not be expected. It was, therefore, a matter of special gratification to me when I discovered a few weeks ago that Professor Delitzsch of Berlin has edited (in the

Abhandlungen of the Prussian Academy, 1914) fragments of a set of cuneiform tablets which contain a glossary with Hittite translations of Sumerian and Assyrian words. This fixes the meaning of the Hittite words quite independently of any one's theory as to the nature of the language. When, then, it appears that these Hittite words have the same form and the same meaning in Greek, the Greek character of Hittite is automatically established. This was not observed by Delitzsch, though it is hard to understand why the obviously Indo-European character of the texts did not impress itself upon him.

I.

In order to facilitate the comparison of the Hittite and the Greek words, I shall transcribe both into Roman letters, ignoring, however, all diacritic marks other than the sign of length. The reader must bear in mind the inexact character of cuneiform writing, especially of the writing found in these provincial texts. Thus, a letter is frequently doubled to no phonological purpose, and, whether single or doubled, may represent any one of a number of similar sounds For example, e or i or ii or ie or ei may spell i. e. e. or ei; and k may stand for k. a. kh. or q, which last became k, p, or t in classical Greek. The nasals m and n are not always distinguished, and so the labials, m, w, and u, and the dental sonorants I, r, and n. In some cases it is still to be determined whether we have to do with inexact spelling or with phonological change, for example, of m to w and of n to r. Moreover, as there was no o in Assyrian and consequently no cuneiform spelling for it, Greek o's were spelled either a or u. It must also be borne in mind that this Hittite Greek is many hundreds of years older than classical Greek and is of the Doric, not the Attic, variety. It is hardly necessary to add that it cannot be expected that the endings will always coincide, any more than they coincide in later Greek dialects, or that the words will always have exactly the same shade of meaning.

I shall content myself in this communication with citing a few typical examples of
each of the various parts of speech. The
English translations that I give of the Hittite words represent the Sumerian and Assyrian words to which the Hittite words
are attached. The pronouns and pronominal adverbs are in themselves sufficient to
show the Greek character of Hittite. We
have already observed the Hittite use of the
Doric datives of the personal pronoun, but
in Hittite these forms have the function of
possessive adjectives, much as mir, dir, ihm
often have in German—

Hittite mi(n) "my," Doric e-min "for me." Hittite ti(n) "thy," Doric e-tin "for thee." Hittite si(n) "his," Doric hin "for him."

But Delitzsch is in error in supposing that mi, etc., are dative possessives, and min, etc., accusatives, as I have made clear in my report on the Tell el Amarna texts. There are numerous examples of the q pronouns

and adverbs. kuis (p. 33) = qis "who"; koron haptein, literally "get children," with Greek tis from qis "who." kuid (p. 27, Z. 22) = qid "what?"; Greek ti from qid "what?" kuid (p. 33) "how?", "when?"; Greek ti from qid "how?" nu kuid (p. 33) "(now) why?", "for what time?", "whenever"; Greek ti nu, "why (now)?" kuussaan (pp. 28, 33) = qoson, "when?"; Greek koson/ poson from qoson "how much?" "how long?" Also nu kussaan, "for what time?" and "whenever," "as long as," that is, used relatively, like Greek hoson, "as long as." With these nu-forms compare kinuun "now." that is, ge nan, Attic age nan "well now," "now," with Doric accent and loss of unaccented initial de.

As Delitzsch observed, there is also a noun spelled kuussaan, dative kuussani, which means "pay," "compensation." This is queon, for qison (compare our cud for quid), from qition, an extension of the stem seen in Greek tisis, from gitis, "pay," "compensation," "retribution." Of other nouns I may cite the following: zaakkar (pp. 28-9) "storm," compare Greek zakhrēēs, "stormy," "violent." khuumaan (pp. 21-23, 24)= komôn "entirety," compare Greek komidê "entirely." pabarrii (pp. 15-2)=pamphori(s) "produce," compare Greek pamphoria "all kinds of fruit." kuutti biraan (pp. 20-33)= kutei peran "circumference of a dish" (Sayce), literally "around a dish," compare Greek kutei peri, "around a dish." turtiganza "be prominent," "jut out," "what is prominent" = turyandzo(s), from turwanyos, whence Greek turannos, "absolute sovereign," especially one who rose to power by irregular means, compare our upstart. There are many Hittite nouns with the suffix -anza(s) = -andzo(s), from -nnyos. The Hittite translations of nouns are, as we have seen, not always word for word; and for this we have reason to be thankful. Thus Sumerlan agisgarra, Assyrlan iskaru "restraint," "that which restrains," is rendered by the interesting clause UD.KAMas (ideograph for "daily," see pp. 19-32) aniigan kuis eessai, that is (hemeran pr)os anian tis ēssāi, "one who overcomes the annoyances incident to everyday life," that is, "one who restrains himself."

Of the adjectives I may mention the following: aara "good"=aro(s), of which Greek aristos "best" is the superlative. meikki and meikkaaes "much," "large," = megi(s) and megās, Greek megas "much," "large." dameeda (pp. 29-15) "fat"=dameto(s), an extension of the stem seen in Greek damos, dēmos "fat." suuwaan "strong"=swon or swoon, Greek s(10)00n, "sound," "healthy." waalkissaraas "strong" = walk-is(t)eros, Greek (w) alk-imos "strong," "brave," both originally superlative forms. The Hittite wshows that alkimos is cognate with Sanscrit varcas "strength."

The many verbs present numerous points of interest. appatar "grasp," "take," "get"= apt-or, from apt-on, which is the mate of Greek (h)apt-en, (h)apt-ein "fasten to," "grasp," etc. Assyrian zaarum "beget" is rendered by Hittite kuruur appatar=koror optor, that is, Doric koron hapten, Attic as the Anglo-Saxons usually used 7 and we ance of unexpected truth.

r for -n in both words. Prehistoric puntho "ask," the original form of punthanomai, is reflected in Hittite bunuussuuwaar (p. 27, Z. 11), the translation of Assyrian sa'alu "ask." This bunuussuuwaar is the clumsy cuneiform spelling of Hittite puns-wor, from punth-mon, with Doric s for th, as in sumos for thumos, etc. The parallel bunuus-kiuwaar, which is used to translate sita'alu, the iphteal form of the Assyrian word, is evidently the perfective k-aorist, out of which the Greek k-perfect developed. This would seem to betray the perfective character of iphteal forms. In other words, sita'alu and bunuuskiuwaar meant "succeed in inquiring," "learn," the idea expressed in later Greek by the middle punthanomai. The Greek perfective ke, which later became the sign of the perfect, is identical with German geperfective prefix, later sign of the perfect participle. sa[a]ki (pp. 9-7) "knows"=sāke, Doric doublet of thake (compare Doric e-samen for e-thamen), is the active perfective form of tha(e)omai "gaze at," with the normal perfective value "succeed in seeing," "realize," "understand," "know." Compare the development of Greek oida, English wot, German weiss, taata luuskiuwar is used to translate Assyrian beduu "loosen." Of these words, taata, the object, is Greek tata "things that can be stretched," and luuskiuwar=luske-wor, is the infinitive of the prefective k-agrist of lu(s)o, mate of Greek luo "loosen." Observe also the infinitives arnuwar "be excited," "be angry"=ornu-wor, Greek ornu-ein "excite," orora "be excited"; and kuunnuwar "fill up," "be full"=khonnu-wor, Greek khonnu-ein "heap up," "fill up." An infinitive, being a verbal noun, often occurs where we might use a noun. Thus arkuuwaar=arkh-wor, "to command." "commanding," "a command," "commands," Greek arkh-ein, "to command."

The adverb-preposition anda occurs in various paraphrases which make it clear that it means "together," "with," "because of." This anda = anta, is Greek anta "against," "face to face," and shows the same shift in meaning that our with underwent, compare withstand "hold out against." German wied (er) "against." Thus, for example, anda tarubbuar "collect together," in which tarubb-uar=tarph-wor, is Doric traphen "curdle," that is, "collect into groups." Compare also the rendering of Assyrian zitum and asasum "mourning," "lamentation," by Hittite anda gan impauwaar and para gan paauar "to be agitated with grief." Here both anda and para, like Greek para, mean "with," "because of"; gan=gon or goon, is Greek goon, accusative of goos "grief," "lamentation"; and paguar, im-pauwaar (compare Greek tromos, en-tromos "trembling") are cognate with Latin pavor "tremble," "be agitated."

The usual negative employed in these Hittite texts is the Assyrian uul "not," rather than the Greek ou, which would be spelled uu in cuneiform. It is probable that the use of the Assyrian word was graphic only, much

sometimes use &, and in arithmetic +, all three corruptions of the Latin word et "and." But twice we find nagta (pp. 9, 36)=mata "not," Greek måte, měte, "not."

It must be understood that the exact form and meaning of a goodly number of Sumerian and Assyrian words in these texts are unknown, or, at least, were not made out by Professor Delitzsch. For example, in the first line dealt with (and similarly in the second) Delitzsch reads Assyrian saninam lag isus. From this he assumes that an initial sa "who" has been omitted by mistake, and translates "[who] has not a rival." But the text is all right as it stands, reading sa ninam laa isuu "who has not everything," which corresponds exactly to the Sumerian gi nu tug (ki nu tuku) "has not everything," ninam being obviously the same as minma "anything," "everything," "all." The corresponding Hittite text is defective. In the fourth and sixth lines Delitzsch mistook Assyrian urtam for the similar irtam and "with extreme reserve" suggested the reading sa teirtam irtam laa isuu "who has not a held-back breast"; whereas the text really is sa teirtam urtam laa isuu "who has not command" (literally, "command issued"), which corresponds to the Sumerian sukar nu tuku "who has not authority," and to the Hittite kuis arkuuwaar naata ijazi "who does not issue commands." It will readily be seen that the effort to make the Hittite text read "who has not a held-back breast" would be hopeless, no matter what language it was supposed to be. In other words, before we can determine the meaning of the Hittite words from the corresponding Sumerian and Assyrian words, we must be absolutely certain what the Sumerian and Assyrian words mean. In fact, I do not hesitate to predict that in not a few cases the meaning of the Hittite word will be determined first, by the aid of the usual Greek form, and that the meaning of the Sumerian and Assyrian words will be determined by that of the Hittite. For example, in the light of what we have seen above, it is clear that kuid maan (p. 27, Z. 17) is qid mān, later Doric ti mān, Attic ti mēn "what then?" which thus gives us the meaning of the corresponding Assyrian aru, which may be a variant of allu "then." In a recent paper in the Journal of the Royal Asiatic Society, Sayce has succeeded in identifying some of the Sumerian and Assyrian words with more success than that which Delitzsch achieved.

The discovery that the Hittites were Greeks will, of course, have far-reaching results. But what seems to me at present hardly less important is the fortunate accident that has put into our hands texts that furnish evidence as to the nature of the language, such as even the most timid conservative must recognize. For we are thus saved in the case of Hittite the delay and the various unpleasantnesses that are prone to mar the transition from the entertainment of erroneous traditional conceptions to the accept-

The Public Schools

PROPESSOR DEWEY'S ADVOCACY OF A BROAD VOCATIONISM-MR. WIRT'S SCHOOLS AT GARY. INDIANA.

The universities having passed through a period of searching criticism, both from without and from within, and having now. with one notable exception, relapsed into some show of equanimity, the same ordeal of popular attention has become the lot of the public schools. Do these schools prepare boys and girls as well as they might be expected to do for the wage-earning life which the large majority, without higher education, are destined to enter? Is not the average curriculum a futile relic of other days? Are we not attempting to drum into children's minds the crystallized knowledge of the adult? These are some of the sweeping questions which are being asked by leading educators. No satisfaction is apparently given by the thought that the situation cannot be hopeless, since numerous products of the abused system have survived it to become men and women of brilliant attainments. The impression is abroad that something is radically wrong with our educational methods, and the sooner we find out what it is, the better for us and our children.

One of the severest critics of the current system, Prof. John Dewey, has presented, in his new book, "Schools of To-morrow," a considered plea for a change to some system which shall be better adjusted to the requirements of everyday life. He feels, perhaps rightly, that a serious wrong is done to the large percentage of pupils who quit school at the age of fourteen and enter industrial positions for which many of them are not fitted, and the bearings of which on life in general they cannot understand in the least. In some fashion a cultural education should be formulated, not out of the usual book learning, but from the materials of the nation's practical existence. It is not technical schools which Professor Dewey has in mind, nor the sort of vocational training which in effect merely adds technical instruction to the curriculum now in use. He would revolutionize education from the first grade on, with the aim of making clear to students the relations of subjects taught to the possibilities that will confront them in after life. The "primary and fundamental problem is not to prepare individuals to work at particular callings, but to be vitally and sincerely interested in the calling upon which they must enter if they are not to be social parasites, and to be informed as to the social and scientific bearings of that calling."

With this desire to steer a middle course between the extremes of bookishness and of the "practical" education, few persons will quarrel. The difficulty is to invent a system which, while drawing its subject mat-

ter from the student's environment, shall from renting houses which are undestrable. not descend to the dead level of materialism. With all its sins upon its head, the current system of education retains some of the spiritual dignity which has traditionally been associated with learning, and there would be an irreparable loss if this should vanish. Professor Dewey, however, is satisfied that the principles he has at heart can already be seen in successful operation in three or four institutions about the country; and the purpose of his book is not only to describe the workings of such schools, but to convince the public that they have a philosophical justification.

The most interesting of recent experiments along the lines which Professor Dewey approves is the organization which Mr. Wirt has built up in the past ten years at Gary, Indiana. Much has been written of late about the Gary schools, and such a following have they won that Mr. Wirt has been asked to experiment with conditions in certain other cities, notably with two of the most congested schools in the Bronx district of New York. We do not say that Mr. Wirt is not deserving of all the attention which he has attracted, but it is most fortunate that his ideas should just at this time be examined by a person of Professor Dewey's competence and be assigned to their proper place in the large scheme of education.

Briefly, the Gary schools were founded to meet the special needs of an industrial town having a somewhat drifting population. The opportunity, as seen by Mr. Wirt, was twofold: to prepare the children of factory workers for useful citizenship, and, largely through the agency of the pupils, to better the conditions of the factory workers themselves. This, obviously, could not be done unless the schools were seen to have practical value and became the accepted centre of intellectual life. With these objects in view Mr. Wirt decided to throw overboard the bulk of the traditional system and to start afresh. One of his most important features is keeping the school buildings open in the evening and on Sundays and holidays, so that there may be public lectures and night classes for parents. He soon found that adults were relying upon the school to answer all manner of questions and were investing it with a community spirit. Instead of being confined mainly to book learning, the pupils, through the training they receive in shops, laboratories, etc., are educated to keep the entire plant running. In the machine and carpenter shops they make the desks, for instance, required in the classrooms. They are encouraged to put into practice the lessons dealing with the nutritive values of foods by selecting the menus and cooking the dishes for the school luncheon. Pupils attend to the bookkeeping and ordering of the school store. They apply their mathematics, among other things, in laying out and equipping playgrounds. They make plans of their parents' houses, and these are studied by all so as to learn the difference between good and bad arrangement, and perhaps dissuade their parents

Without attempting any full description of the Gary schools, we may note also that, though the pupils are graded, those of all grades-or roughly of ages from four to nineteen-are to be found in one building, Mr. Wirt's idea being that if young pupils are constantly thrown with older pupils and on occasions serve as their helpers, especially in the shops and laboratories, there will gradually be implanted a real perspective of education. It must not be inferred that students are not drilled with textbooks, and in such subjects as history and Latin, only lessons without application count for less than faith without works. By numerous devices knowledge is vitalized for old and young alike. Little children are not kept poring over books, but are set tasks which allow their bodies free play, such as clay modelling and basket-weaving. Boys in the higher grades are allowed to spend much time in working out the intellectual and mechanical problems connected with the vocations which, so far as they are able to decide, are to be theirs after leaving school. That Mr. Wirt succeeds in making knowledge attractive is attested by the number of his pupils who continue their studies after reaching the legal age when they are free to retire, and by the considerable percentage of students who go from Gary to the State universities.

Mr. Wirt's labors at Gary, so far as we can judge, have borne rich fruit. He is giving to children, often of foreign-born parents, an American self-reliance and is helping them to become useful citizens. By a system so flexible that it responds easily to the peculiar needs of the individual, be he dullard or prodigy, he is apparently able to keep all the students actively interested. A system which does this in days when even our colleges are complaining of the blase spirit of youth should not lightly be dismissed. Yet it is a question whether Mr. Wirt's methods, except for the revolutionary extent to which he has applied them, differ from the practice which has been attempted by the colleges themselves; namely, the introduction of courses, especially in the department of economics, which prepare visibly for positions in business. Or there are courses in sociology which are occupied almost entirely with a classification of the statistics gathered by students in their "field work." As is well known, the colleges have been widely criticised for this very emphasis put upon the practical, because of the further impression given that the so-called cultural courses have no real value. It has been felt by many that the endeavors of the colleges to bring themselves up to date have gone far enough, and that faculties would be wise if they took for granted the usefulness of the humanities and of pure theory.

The problem as applied to the public schools is, however, special. There the grave fact has to be faced that the education of an enormous number of children ends at the age of fourteen, and that they are compelled to

meet the world with little more than the three R's at their command. For it is not to be supposed that at that tender age the wider significance of the usual book-learning can be firmly grasped. Yet, even so, should we by a sweeping change endanger the cultural training which our high schools are giving to hundreds of thousands of students? Professor Dewey would doubtless answer that this begs the question, since the Gary system, if universally applied, would bestow as much, if not more, culture. We are not so sure that it would. In the hands of so vigorous a personality as Mr. Wirt it may show almost limitless possibilities. It is true that Christ taught spiritual values by reference to such commonplace objects as money changers and fishermen and granaries. But a system which places the emphasis consistently on application to everyday life can scarcely fail, if untouched by an imaginative teacher, to deal almost exclusively in the material.

Now, whatever else the schools of the country may have done, they have shown a wholesome respect for theory, and by requiring pupils to be occupied some of the time with subjects remote from practical interests have given an inkling of that background of life without which existence would be dull and flat. Of the two extremes, it is perhaps best that pupils should understand little of what they are taught than that they should fully understand all. Mr. Wirt circulates printed reasons for studying Latin. Some of the reasons for learning this language can be made intelligible to young folk; others can not. Is it well to create the impression that every subject, in order to justify itself, must have a raison d'être visible to the naked eye? All education should be practical in the sense that it should fit into a useful scheme of the universe; but the use of some portions of it need not necessarily be felt by students until long after they have left school.

This seems to us to be the one considerable flaw in Mr. Wirt's system. He has improved enormously on the trade school by equipping students not for one given occupation but for any one of many, and he has no doubt demonstrated the need of making great changes in the curricula of the public schools. But before casting off the whole apparatus of a scheme which has grown as an organism through the ages, we shall do well to make sure that any substitute does not neglect the advantages of pure speculation. Over this aspect of the question Professor Dewey, who carries the principles underlying the Gary system back to the educational theories of Rousseau, seems not to be greatly concerned. And it must be confessed that the picture which he draws of the workings of the Gary schools is most alluring. One might fancy that the attention there given to correlating the various branches of knowledge would in itself furnish a broad outlook. We wonder, however, whether the pupils at Gary catch the vision of it with anything like the clarity with which it strikes Professor Dewey.

Communications on Educational Topics

PERIODICALS IN COLLEGE ENGLISH COURSES.

TO THE EDITOR OF THE NATION:

Sir: An interesting development of the past four or five years in the college teaching of English has been the increasing use of periodicals as supplementary reading. The Atlantic Monthly, I believe, was the first to enter the field. Some enterprising instructor conceived the idea of having a class subscribe for the Atlantic; the idea was, of course, encouraged and well advertised by the publishers; and there is now a long list of colleges, normal schools, etc., in which the Atlantic is regularly used. A club rate is offered to classes for three or six months' subscriptions. Several other periodicals, including some of the best weeklies, like the Nation, now offer similar rates to college and other classes.

My own experience has been confined to the use of the Atlantic for one semester in a sophomore course in exposition. The results, though not conclusive, were in some respects disappointing. I hope that other teachers who have tried the plan may feel like discussing it in your columns.

Some of the advantages of the plan are obvious. A surprisingly small percentage of college students read regularly any good journal; and any device which will lead more of them to form the habit of reading a serious weekly or monthly is worthy of consideration. The benefits may vary somewhat according to the periodical chosen; but all the publications now being used in this way have genuine value. A suspicion may be roused in the skeptical mind, however, by the general tone of the letters from teachers quoted in the publishers' circulars. The point which most of them emphasize is the increased interest in class-room work. Many of them run something like this: "Since we substituted the - for our reading list of classics, the interest of class discussions has more than doubled. The students have come to see that the principles they have been studying are something more than abstruse rules followed by great writers in the past; that they have a vital and practical application to the discussion of present-day problems," etc. It would appear almost as if some of the teachers had discovered for the first time that the principles of composition are something more than fossil remains. If so, here is, of course, another argument for the plan. But it seems needless to remark that a good teacher ought not to require the help of a magazine in making the vitality of his subject realized. One is led to suspect that a principal reason for the wide adoption of the plan is that it makes the immediate task of the teacher vastly easier. But is class-room interest, by itself, an adequate test of teaching? Has the teacher done enough if he has kept his class interested, at the same time trying to cultivate in them a taste for good journalism? Of course, it is easier to interest students momentarily in current journalistic writing than in Burke or Swift or Arnold; the real question is whether the teacher who throws over his "reading list of classics" for even the best of journalism is not sacrificing permanent to temporary

Is the interested student really acquiring and carrying away from his periodical reading anything like the equivalent of what he would get from a well selected list of classics? My experience suggests that he is not. I tried the experiment with the periodical which seemed best fitted for the work in hand. Although the class showed a lively interest in the essays while they were being discussed, the ideas and impressions remaining in their minds at the end of the term proved painfully slight and vague. The fact is, of course, that no periodical can present a series of articles comparable in substance or form with a well chosen list of great essays. The accidental interest of timeliness by no means compensates for the lack of more solid qualities. The habit of reading the magazine, however, if it is continued by a considerable number of the class, might turn the scale in favor of the new plan. One point on which I should be glad of information is this: about what per cent. of an average class form the habit of reading the journal used? Teachers who have followed the plan for three or four years may be able to throw some light on this question. If we are to judge between reading a periodical merely for three or six months and reading a corresponding amount of standard literature, the verdict, I think, must be against the periodical. HOMER E. WOODBRIDGE.

Colorado Springs, September 5.

A NEGLECTED ASPECT OF GRADUATE INSTRUCTION.

TO THE EDITOR OF THE NATION:

. . . we have never expected the graduate schools to train for a career in literature; they have a distinctly different aim: to turn out teachers. The man who goes to a graduate school in order to become an author is patronizing the wrong shop.—[The Nation, May 14, 1968.

Such was the reply of the Nation to a correspondent's protest against what he considered the throttling by graduate schools of all creative literary work, and while some of those who obtain higher degrees may devote themselves exclusively, or as a side issue of academic life, to literature, research, and expert work of various sorts, the statement above will, I think, be accepted without question. It was not challenged in the discussion to which the letter and editorial gave rise, and surprisingly, no one pointed out that the methods used are neither in theory nor in fact adapted to fulfil the aim of training teachers—an inconsistency that is seldom remarked, and rarely, if ever, stress-

Graduate instruction in the United States, either implicitly or avowedly, is so conducted that the students receive a certain amount of information and are shown where to find a greater amount, the object being to approximate a complete disclosure of the sources of knowledge in a particular subject. Even the undergraduate system of lectures, in part at least, accomplishes this, but the graduate differs from the undergraduate work in that the students are expected to do more than absorb facts; they are shown the scientific methods of able professors in attacking and expounding particular problems. If the preparation of teachers is the aim of the instruction, the graduate student should be equipped not only to pass

on the information which he has acquired from the lectures and collateral work, but to present it in such a way that his undergraduate students will easily comprehend and become eager to learn more. In this sense, graduate and undergraduate instruction differ in degree as well as in kind, but the advanced lectures, properly appreciated, are calculated to enable the student to acquire the information and, in some measure, the knowledge of methods necessary for collegiate work.

But the other, perhaps the more important and certainly the more distinctive, feature of graduate instruction is the training in research. The "indispensable adjunct to true university work" is the seminar, and its raison d'être is "to teach the student how to handle his material and by interpretation or discovery to make a contribution to the store of existing knowledge." Nowhere, however, in the symposium by graduate professors on the true function of the economic seminar. from which the quotations are taken, is there any mention of the fact that the vast majority of those trained in the seminar will be expected to conduct undergraduate classes. The training is wholly in research, in scientific methods, in scholarly habits of thought -all, it is true, highly important for a successful teacher, yet all primarily designed to induce future productivity. A few those who begin an academic career may be permitted, from the first, to present the results of original investigation; yet the majority, either for life or as a preliminary to something else, must give instruction to college students, and nowhere in the scheme of graduate work that I have roughly outlined is this fact avowedly considered.

It is perhaps permissible to point out that only graduate schools have neglected the aspect of instruction that I have been considering. In medicine, for example, the student acquires knowledge; what is more important, however, is to put this knowledge into practice, and he learns how, not by doing research, but in making people well. His training in dispensary and hospital, under competent guidance, is a most important part of his course. At the law schools of the country, much attention is devoted to moot courts where the future lawyers meet and fight out disputed issues just as in the trial of a real cause. The same is true of theological instruction, and perhaps this analogy is closest, for both the clergyman and the teacher give the public not what it demands, but what is good for it. At the theological schools a man is prepared, among other things, to preach, and before he graduates he is taught the principles of preaching and receives the opportunity of putting them into practice. Even in the schools of journalism -a recent development of professional education-the students write "stories." "build" head-lines, and practice actual newspaper work. But in graduate instruction, although the object is to train teachers, there is no effort made to do this; the student receives his degree as evidence of his fitness to teach, and neither the professor nor the student himself knows whether he can do it.

Such is the problem by which, as a graduate student, I have been puzzled. A remedy I do not propose, and, above all, am not so rash as to imply that there should be any required study of the pedagogics of undergraduate work, as is the case in Europe. My

voted to training the student in oral and extemporaneous discussion of problems, and that, before turning him out into academic life, the professor should discover whether the student is able to teach. In the discussion of the economic seminar to which I have already referred, Professor Taussig stressed the fact that at Harvard the reading of papers is frowned upon; the students are desired to talk, but about original work that they have done. This is a tendency in the right direction, but certain it is, I think, that the seminars, discussion clubs, reading classes, however conducted, make little, if any, conscious effort towards giving a student instruction and practice similar to that which, in the strictly professional schools, is considered well-nigh indispensable both for rounding out his training, and enabling him to see, ofttimes, that a mistake has been made in his choice of a vocation. LINDSAY ROGERS.

Johns Hopkins University, Baltimore, Md., August 15.

COLLEGE COMPOSITION.

TO THE EDITOR OF THE NATION:

SIR: Still the crop of books on composition is ripening: you can almost hear them patter; you can almost see them fall. To-day it is Business English and Correspondence; yesterday it was Prose Narratives and Essays in Exposition: these latter followed Essays in Modern Thought and Essays for College Men; and these, in turn, were preceded by Theory and Practice of Technical Writing, and always the host of rhetorics, each emphasizing a cherished discipline. In the old days it was the intensive study of special authors, with composition on the side, and in the days before that, treatises on rhetoric as a branch of philosophical inquiry. Rhetoric to the Greeks was again quite another matter. And so the thing goes round and round, not, to be sure, in a perfect circle; there are wheelings within wheelings, epicycles, conic sections (to indulge the figure), and hyperbolas. Perhaps this whirl is not so wanton as, at first glance, it appears. It may somehow spin itself into order. Anyway, aggressive differences are supposed to be more excellent than a satisfied hush.

But just where we are now, whither we are tending, what the study of composition will be twenty years hence, only a very bold man will venture to prophesy. One condition, however, is apparently stable, as stable as a multitude of facts and constant iteration can make it so-the average youth of to-day in this country murders his native or adopted tongue. And that is why "English" has been made compulsory in our colleges; why, also, as the condition does not seem to improve, new schemes (never new) and fresh methods (never fresh) are being constantly flipped into the caldron.

Composition in the lower schools is also suffering at this moment from hectic theory and experiment. A rather frail wagon is hitched to its star. The over-emphasis on oral composition threatens to magnify the pupil's readiness at the expense of his exactness, and the plethora of "dramatization" may divert the few at the expense of disciplining the many. The facts proclaim that highschool pupils need more of a call to drill and less of incitements to glory. The special pleaders, however, who appear to occupy the point is simply that some time should be de- high places, are turning out pupils with a strangely distorted conception of what the nature of composition really is, how stern and humdrum and modestly useful, as useful When composition in fact, as grammar. again comes to its own in the high school perhaps the college will find that it can at a while and ponder. The conclusions of this questioning, to be sure, will be devious; there are intimations, however, that a good many teachers are calling for a separation of composition as taught in the high school from composition as taught in college. They reason somewhat in this wise.

Why have the departments of English is our colleges been carrying the entire burden of composition? Has, indeed, composition a more intimate relation with imaginative lit. erature than it has with any other kind of literature, the sort that historians write, for instance, or scientists or philosophers? To be sure, it has not, and to establish the fact the unnumbered compilations of "models" are replete not only with their descriptions and narratives (belles-lettres), not only with their criticisms, their discussions of the curriculum, their unending disputes between science and literature, but as well with their legal and political documents, and finally with the most profound matter-whether we ought to believe or ought not to believe, and if we believe, how much belief will leave the soul pure. The department of English is straining to become a forum of discussion of all questions that have assailed human intelli-

Now, the motives underlying this appropriation on the part of the teachers of English are surely unexceptionable. Why should not students be put in touch with the whole range of thought? Yet what a load it puts upon one department! These instructors of English are asked to become actively conversant with science, politics, philosophy. Though still devotees of belies-lettres, they are also striving to speak with authority on every other subject. The wisdom of the age is theirs. Frankly, the assumption is rather startling. May not a cog have slipped somewhere?

Would it not be possible, we wonder, to inveigle other departments-history, economics, philosophy-to take upon themselves a part of this burden? The department of English could furnish them with sterling models; it could point to the choicest titbits of a century. How to handle argument it knows from the enunciation of the question to the final clinching sentence on any side of any subject. An able-bodied instructor in economics, say, could cover the whole field of argumentation in a week of evenings. Perhaps he could even simplify the scheme a trifle.

If departments other than that of English would be willing to shoulder a part of this burden of composition, there might be some wholesome readjustments all along the line A teacher of the subject in the lower schools might still be attached to the department of English. The pupils there are less apt to be called upon to sweep the horizon. But in college this assumption of a knowledge of the universe is in danger of inducing mental breakdown. Sometimes it would seem as if the new departments of journalism were unique in knowing what they are driving at And when it is certain that they bid for quality as well as for numbers, and content themselves with a special field, it looks as if they could care for their own. But those students who are not attracted to journalism

are turn whose al ginative tion on ncroach training ng. If who com nger B phylous nomics. ettresxpressio those wi

are turned into the department of English, whose apparent function is the study of imaginative literature, but whose present vocation on the side of composition is a vague encroachment into fields for which their training is palpably not of collegiate standing. If colleges would only insist that those who come to them shall submit stuff that no longer needs to be proof-read, there is no obvious reason why all departments—economics, history, science, philosophy, bellestetres—should not attend to their students' expression. Advanced courses in rhetoric for those who desire a special training could well be manned by the department of English.

Such a scheme as I have suggested demands, to be sure, much further discussion. I simply offer the foregoing as a sort of footnote to much that has already been written on this disquieting topic.

Colorado Springs, July 10.

A SUGGESTION FOR HUMANIZING ELE-MENTARY LATIN.

TO THE EDITOR OF THE NATION:

Six: No doubt the war has given considerable impetus to the study of Cæsar in the schools. Perhaps it is therefore an inopportune time to call attention to the disadvantages of the "Gallic War" as the first piece of Latin literature studied by most pupils. It may seem an impertinence, too, for one who is not a Latin scholar, but only a lover of Latin, to express an opinion in regard to Latin teaching. Yet I should like to advance for what it is worth a suggestion which I have had in mind for some time, in the hope that it may be discussed by those who are better fitted to judge of its value than I am.

It originated in my brief experience in teaching high-school Latin a number of years ago. In the earlier years the chief difficulty, I believe, is in getting pupils to realize that Latin is a language which people actually talked and thought and lived in. When a student has once grasped this fact, he can scarcely fail to be interested. Now, from this point of view, I think it would be rather hard to select more inappropriate books for the beginner than the "Commentaries," Cicero's Orations, and the "Æneid." It is as if, in French or German schools, the beginner in English should be required to read first Gibon and then Burke, with "Paradise Lost" as the next course, and as if the primer were to be based on Gibbon! Is not the analogy a fair one? And could any student imagine, or any teacher be expected to convince him, that English was anything more than an elaborate instrument of great writers? Would the foreign student dream that people made love, and swore, and gossiped, and quarrelled in that stately and formal medium with which he was so imperfectly acquainted?

My suggestion is briefly this: that instead of driving the beginner through an elaborate military history, with its intricate grammatical constructions and its artificial word order, utterly different from anything he has known, we should lead him to literary Latin through colloquial Latin, using Latin comedy as a basis. I know that in recent years encouraging experiments in this direction have been made; but so far as I am aware, they have not included my capital point—

the substitution of Plautus for Cæsar as a basis for elementary texts. Let some scholars select two or three of the plays of Plautus; perhaps the "Menaechmi" and the "Miles Gloriosus" might be used. Let these be expurgated so far as is expedient, and edited for the beginner, and let a first Latin book based on these be prepared. I must not trespass on your space by arguing at length the advantages of such a plan, but perhaps I may mention some of them:

(1.) The average student would find Latin far more interesting, because he could scarcely fail to recognize early that it is a language in which people lived.

(2.) He could begin earlier really to read Latin, and would find it far easier, because two of the great difficulties, elaborate construction and artificial word order, would be in considerable degree postponed till he was ready to grapple with them. There is difficulty enough for the beginner in acquiring a new vocabulary and a new grammar; the difficulties of formal literary style and artificial word order would be much less formidable if they could be postponed till the student had in some measure mastered the others.

(3.) The general vocabulary which the beginner would acquire in reading Plautus would be on the whole more serviceable to him in his later reading than the specialized military vocabulary of Cæsar.

(4.) A knowledge of Plautus would be more valuable to him in his study of modern literature than a knowledge of Cæsar. I need not point out how essential to the understanding of either French or English comedy is some knowledge of Plautus. On the other hand, Cæsar's influence upon modern literature is almost negligible.

After the student's reading of Plautus, I would have him read parts of the "Metamorphoses" and of Petronius; then something of Cicero—perhaps a couple of orations, the "Somnium Scipionis," and some selected letters; then something of Livy or Sallust, and of Virgil. The details of the programme do not especially matter; it might be varied in numerous ways. But would not such a list of books present Latin literature as a far more human thing than what the schoolboy sees at present? And would it not be practicable?

If this plan really has the advantages which I have mentioned, it should enable the student to make considerably more rapid progress than he now makes. It might enable him to meet the entrance requirements of the more liberal colleges even as they stand. At all events, I should like to see the plan discussed.

Chicago, August 26.

RELIGION AND AMERICAN UNIVERSI-

TO THE EDITOR OF THE NATION:

Sir: It is a current misconception that our undenominational State universities are irreligious, whereas from personal experience with at least four of the leading institutions in America I am led to believe that State and undenominational institutions are actually more religious than so-called out-and-out denominational institutions. Perhaps the reason is self-evident. The denominational institution must be on its guard against the attack of overdoing religion or rest on the

assurance that the denominational name makes it sufficiently religious; while the undenominational institution must ward off the charge of irreligion by emphasizing the religious and moral life. For example, take the University of Illi-nois, which had a great task, especially about a dozen years ago, in convincing the people of the State that the institution was not irreligious. To-day it would be difficult to find a university in the country that is pervaded, both faculty and students, by a deeper religious atmosphere, where the faculty are so little given to boasting skepticism and making light of orthodoxy and tradition. And yet the University of Illinois holds neither a daily nor weekly chapel service, all such functions being performed by the Y. M. C. A. or denominational student churches. The moral atmosphere is unusually high and the community has been dry for several years, a State statute forbidding a saloon within four miles of the University. Smoking is prohibited on the campus and about the buildings, although the reason is protection against fire, since the State of Illinois does not permit the University to insure its buildings.

But though, as at the University of Illinois, some of our denominations have student churches for the purpose of "holding together" the students of their denominations, anything like a concerted, well-organized, and well-standardized work in religious education is lacking. For some reason, the denominations have not felt this decidedly strong obligation to create a thoroughly standardized coöperative school of religion as an adjunct of the undenominational university, where courses in religion can be put on an equal basis with all of the courses of study of a university curriculum.

Here is the problem, more concretely. At a meeting of the representatives of one of the largest denominations in the United States, it was discovered that the denomination had more of its students at the University of Illinois than in all of its denominational colleges in the State combined. According to a recent report of the Registrar of the University, of a total of 3,253 voluntary answers, there were 907 Methodists, 617 Presbyterians, 264 Congregationalists, 239 Disciples, 228 Baptists, 214 Catholics, 195 Episcopalians-with forty-one shades of belief, including one agnostic, one Confucianist, and several Hindus. While money is being spent, therefore, on a couple of hundred students in a denominational institution, why should the obligation to twice as many thousand at a great university be neglected? Theological schools of a bare hundred students have an endowment of a million dollars, but where is the Christian financier who wishes to invest his thousands of dollars at one of these undenominational centres of learning where every year there are thousands as against the hundreds who in a score of years will be the churchleaders as well as community-leaders wherever they chance to be situated?

It may be argued that we have not yet attained a sufficiently high standard of civilization to cooperate in religious education. Then, where is the Moses of religious education to lead the denominations out of the wilderness by doing for them what Andrew Carnegie has done for libraries and the Rockefeller Foundation for the small college—namely, to create a school of religion at an undenominational university?

VERGIL V. PHELPS.

Urbana, Ill., June 11.

REVIEWS

AN EXAMINATION OF THE TEXTBOOKS PUB-LISHED SINCE LAST SPRING AND OF CER-TAIN OTHER WORKS BEARING ON EDUCA-

EDUCATIONAL THEORY.

"Education for Industrial Workers" (World Book Co.; 90 cents), by Dr. Herman Schnelder, who organized the cooperative courses in connection with the University of Cincinnati. is by intention Dr. Schneider's share of the Hanus report upon the New York city schools; in fact, it amounts to a brief and rather interesting exposition of the author's ideas about industrial education. Of particular interest is the distinction between the energizing and the enervating trades-such as those which involve the automatic process of feeding a machine. Dr. Schneider points out that industrial education has hitherto favored the energizing trades, in which also the nature of the work renders the mental conditions more favorable. Yet the larger and more pressing problem relates to the enervating trades; and for this the author offers no clear solution.

Probably few of our readers are interested in rural schools. Yet a book of well-considered practical suggestions for the elementary teacher, written in clear and dignified English, with no pretension to educational philosophy and an entire freedom from cant, by a supervisor of training in a State normal school-such a volume is surely worthy of note; and such is the little book entitled "Everyday Pedagogy: With Special Application to the Rural School," by Lillian I. Lincoln (Ginn; \$1).

A different and more typical product of the normal school is E. L. Kemp's "Methods for Elementary and Secondary Schools" (Lippincott; \$1.25). Gov. Brumbaugh's Introduction assures us that, in contrast to all other works upon method, this is the vital and real thing. Mr. Kemp adds to the obvious a certain warmth of eloquence; otherwise his book does not differ from others of its class.

"Learning by Doing" (Bobbs-Merrill), by Edgar James Swift, of Washington University, is a fine example of pedagogy with a punch. The latest volume upon Youth and Doing is marked, like the others, by that peculiar effervescence of style which is characteristic of the Saturday Evening Post, from which some of the material is drawn. We have no doubt that "Learning by Doing" will be a pedagogical best seller.

That "Handwork as an Educational Medium" (Macmillan; \$1), by Philip Boswood Ballard, should call for a second edition seems to indicate that English school teachers are not yet as completely saturated with pedagogical literature as those of the United States. The arrangement of the book suggests a somewhat haphazard collection of essays following in the main the ideas of Professor Dewey. Yet most of the chapters are good reading; it is clear that Mr. Ballard writes from independent personal conviction. And the chapter on Ambidexterity, if somewhat parenthetical, is curiously interesting; in this chapter we learn of an Ambidextral Culture Society, whose views Dr. Ballard con-

"History of Education," by Patrick J. Mc-Cormick (Catholic Education Press, Washington, D. C.), is scholarly in tone, and makes the subject interesting. Though written especially for Catholic teachers, we think that the Protestant reader would find few grounds for complaint. The book differs from other textbooks of the history of education mainly in the emphasis laid upon mediæval education and mediæval universities, which, according to Prof. McCormick, not only preserved the literature of antiquity, but laid the basis of the education of a considerable portion of modern society. "What has survived to-day in university or higher education, and largely in secondary, is the direct bequest of the scholastic teachers."

Under the title of "Readings in Vocational Guidance" (Ginn; \$2.25), Meyer Bloomfield, of the Boston Vocation Bureau, has collected some forty-odd addresses, articles, and reports, mostly by writers well known in the field of education, which form as a whole a kind of small encyclopædia of vocational guidance. Some of the articles are theoretical, but the greater number are concerned with special aspects of fact, such as the conditions and opportunities in various occupations and in various places, and the natural vocational choices of children in the schools. The contributions are naturally of unequal merit and importance, but the book is the first extended presentation of the ideas and facts underlying a new movement, and it should be a useful volume to those who wish to study the possibilities of vocational guidance.

The dean of women is a new figure in educational circles. She has arisen in the last quarter-century as a result of the growth of co-educational colleges. Beginning with the anomalous office of preceptress or adviser of women, she has gained in dignity until, in the State universities of the West, she enjoys the title and authority of a dean. This development is recited in a somewhat querulous voice by Lois Kimball Mathews in "The Dean of Women" (Houghton Mifflin; \$1.50). The problems and duties of that dignitary are yet ill-defined and far from uniformly interpreted. In fact, Dean Mathews is the first to essay a discussion of her position and opportunities. For this important task she is excellently equipped. She not only has the experience necessary, she not only takes a broad view of the educational situation, but her understanding of young women is intimate, and her vision is not dimmed by prepossessions in favor of her sex. She casts no halo of glory about the undergraduate girl. She perceives clearly the difficulties that confront her and her besetting weaknesses. Such practical matters as living conditions and means of employment she discusses with the same clarity and ease that are found in chapters on Self-Government Associations and Problems of Student Discipline. Vocational guidance is not brought out of the nebulous state in which it now floats in most minds, but the social life of the students, with their eagerness for extra-curricular activities, as well as their intellectual life and "docile minds," are described from sage experience. For the office of dean of women the writer has a jealous regard. The incumbent should be a scholar who will win respect from the most austere of her male associates. She should be a teacher of exceptional ability to expound and in every student's library.

inspire. She should discharge her adminis. trative duties with ease and dispatch, never making a mistake of judgment and always stoutly abiding by her decisions. She should not only be able to dress with taste and distinction, and to entertain university pres. dents and awkward freshmen with equal grace and charm, but she should likewise have run in her own life a wide gamut of joy and sorrow, in order that she may help sympathetically all the various types of giris in her charge. In short, all requisites are mentioned except a pair of wings. As a counsel of perfection the volume should all all who are beset with the perplexities surrounding the administration of the women's part of a university.

A wholly admirable handbook and guide for parents and others interested in private schools is Sargent's "The Best Private Schools" (Boston: Porter E. Sargent). It is an attractive volume of convenient size, an. nounced as the first of a series of annual handbooks relating to education and travel. Various divisions of the book consider boys' schools, girls' schools, co-educational schools, special schools (including those devoted to neusic, art, kindergarten training, physical education, dramatic training, household arts). the private schools of Canada; directories of associations, periodicals, teachers' agencies. outfitters and dealers in school supplies. All this information is compactly and agreeably given. There is a brief history of each school, and a description of its character and peculiar advantages. In reading these accounts one feels that the writer is fair in bis judgments, and that he is quite able to tell a good school from a bad one-even if the latter is brought to his attention by a glowing prospectus. One is reminded often of Baedeker. (Here it might be stated that school authorities are requested to send Mr. Sargent their catalogues and announcements) We believe that many fathers and mothers will find this handbook most useful.

In "The College Course and the Preparation for Life" (Houghton Mifflin; \$1.25), President A. P. Fitch, of the Andover Theological Seminary, discusses the serious problem of the instruction of undergraduates in our colleges. The "talks," given at Williams College, are manly and racy. Dr. Fitch speaks as a older comrade who knows the intellectual and spiritual difficulties of the undergraduate, and appeals to his common sense and to his higher ideals. Defining religion, not as dogma or custom, but as a force and a life, he urges on the young student the fact that the object of the college course is to make of him a thoughtful and conscientious man. He insists on a broad scheme of study, one fitted to give a full and well-rounded development, dwelling particularly on the value of scholarship and the cultivation of a taste for the beautiful. Collegiate illiteracy he pictures with friendly ridicule and biting sarcasm. Read widely, he says, going perhaps a trifle too far in liberality when he advises that "Tom Jones" should lie on the student's study desk as it lay upon Lowell's; "Tom Jones" is not food for babes, and Lowell and the undergraduate are two different persons. Dr. Fitch's volume is a vigorous and persuasive presentation of what the undergraduate may and should do, and it deserves to find a place

ENGLISH.

LINQUISTICS.

The revision of Emerson's "Middle English Reader" (Macmillan; \$2 net), the most useful book in its field, shows some improvements over the first edition, for a year or more The glossary, the least satisout of print. factory part of the original volume, has been entirely recomposed and purged of a handful of "howlers" that disfigured it. The list of irregular verbs has been omitted, but in compensation inflectional forms appear more numerously in the glossary. A few corrections have been made in the notes. Bishop Poor now appears correctly, but somewhat paradoxically, as "Rich. Poor" (p. 305). In some cases, as in Trevisa's translation of the "Polychronicon," the text has been re-Additional matter may be found here and there in the valuable grammatical introduction. A point or two escaped correction; in §94 "O. E. palatal stop c" should read "guttural stop," and "W. S. hleihan," in \$103, 2, has an odd look.

BHETORIC AND COMPOSITION.

The book of the hour for the college student is the volume of essays, usually pretty solemn, designed to start in the freshman a flow of ideas on such subjects as evolution, democracy, theology, and the like. Two rather refreshing variations of this type are "Modern Essays," selected by Prof. J. M. Berdan, and J. R. Schultz and H. E. Joyce, instructors in Yale College (Macmillan; \$1.25 net), and "College and the Future," edited by Prof. Richard Rice, jr. (Scribner). In the first the selections are almost without exception of the twentieth century, or not long before; Whistler, Chesterton, and Stephen Leacock are only some of the essayists who give an airy lightness to the collection. It is pleasant and interesting throughout. There should be no great difficulty in getting college students to read it, at any rate; particularly Yale men, for the home product is amply represented.

Professor Rice's selections are serious, but they deal for the most part with questions as they concern campus life—Oxford, athletics, religion, studies. Indeed, the "college," in the hands of Newman, William James, and many others, including the compiler himself, is rather more adequately treated than the "future," which might, perhaps, in a book of this kind have been left to take care of itself, instead of to H. G. Wells.

Prof. John Louis Haney has arranged alphabetically under the title "Good English" (Philadelphia: Egerton Press) a number of notes on linguistic usage, many of which were contributed to the Ladies' Home Journal. Some very obvious errors and some extremely recent locutions receive comment, but the book is not a mere list of "don'ts"; it is tolerant in its judgments and sensible in its explanations. No one will grudge the author his occasional little dogmatisms. When he assures us that "where should not be used for in which, as, "This is the house where I lived for ten years'" (p. 225), we are fain to remember "the house where I was born."

A similar and briefer list forms a useful Bunner to the sublimity of M appendix to Genung and Hanson's "Outlines of Composition and Rhetoric" (Ginn; carry an air of completeness.

\$1). For the rest it follows traditional lines in the discussion of structure and type, inculcating its doctrine largely by means of horrible example to be corrected.

Picking up a new collection of short stories, one wonders what excuse the compiler can offer for his undertaking. In a field so thickly sown, why should a new head appear? But Mr. Leonard B. Moulton has proved in "Short Stories" (Houghton Mifflin; 40 cents net) that there is room for one more volume. He has no historical bee in his bonnet. The Egyptians and Boccaccio are left centuries behind. The great masters of the form are almost entirely neglected. The classics in this genre are uniformly omitted. Neither is he a worshipper of technique. Atmosphere and character and suspense are no more the goal for the student than they have been the guide for the editor. The result is an unusually fresh set of short fiction, gathered together because the life dealt with therein was thought to be of interest to boys and girls in high school, for whom the selection was made. The introduction, for the pupil, is little over four pages in length. The note following each story, omitting all biographical detail, indicates clearly by questions the content and significance of the specimen. There is comment on the craftsmanship or art of the narrator, but only such comment as should help to increase the pupil's pleasure in short fiction. In sympathetic hands the book ought to accomplish much in arousing an intelligent liking for this popular form of art.

Variety is the dominant note of the attractive volume, "Writing of To-day: Models of Journalistic Prose," made up of articles chosen by Profs. J. W. Cunliffe and Gerhard R. Lomer of the School of Journalism at Columbia University (Century; \$1.50 net). This variety is exhibited in range of matter presented, which includes descriptive, narrative, editorial, and humorous articles, as also interviews and criticism, literary, dramatic, musical, and art; it is shown also in the length and character of the selections. Every group of them is prefaced by a concise analysis of the kind of writing represented in it, with practical hints for the novice. There is no denying the interest of the contents of the volume, with its accounts of "The Miracle of the Movie," "How I Found the South Pole," "Henry James's First Interview," "The War in Art," and so on for a hundred titles more, but the question is whether the pupil in English composition will find the ways to satisfactory writing better greased by these examples of "subjects of immediate interest" than by the traditional subjects "outside of his every-day interests." An outsider is tempted to fancy that a pupil would be as disheartened by having James Bryce's "Impressions of Palestine" held up as a model as he is supposed to be by the masterpieces of Addison and Macaulay.

SELECTED TEXTS.

As a supplement to the work in composition and rhetoric, a volume of "Readings from Literature" has been prepared by Reuben Post Halleck and Elizabeth G. Barbour (American Book Company). Prose and verse alternate, moderns jostle "classics," rising in a sort of climax from the ridiculousness of Bunner to the sublimity of Milton. It must be said the selections are interesting, and carry an air of completeness.

The Oxford University Press has just published Abraham Cowley's "Essays and Other Prose Writings" (\$1.10), edited, with an introduction and notes, by Alfred B. Gough. It is the best inexpensive annotated edition. The volume contains all of Cowley's prose, except his preface to "Poetical Blossoms" and his letters. Each of the texts is based upon the first edition, including the very rare 1661 edition of 'A Vision concerning Cromwell the Wicked." The introduction gives a trustworthy account of Cowley's life, a judicious estimate of his personality, and sufficient bibliographical guidance; but it says too little about Cowley's position in the history of English prose. Dr. Gough's comments on this important topic are, one regrets to find, scattered among the notes, where they are likely to be overlooked. The notes fill two-thirds as much space as the text; and leave no difficulty or allusion grammatical, literary, biblical, or historicalunexplained. Some of them seem (to paraphrase Butler)

> Fit to take lodgings in a head That's to be let unfurnished.

It is doubtful whether any one likely to read Cowley requires a definition of such terms as "syllogism" or "mountebank." Yet the careful explanations of Cowley's allusions to ancient and modern political history unfortunately cannot, in the present state of undergraduate knowledge, be considered superfluous. Dr. Gough's critical interpretations are on the whole sound, but somewhat limited in range. For example, he does not point out the value of the "Preface to the Cutter of Coleman Street" as the first important dufence of Restoration comedy against just the kind of attacks which it long endured but to which it finally succumbed. In commenting upon "A Vision Concerning Cromwell," he is so preoccupied with correcting errors arising from Cowley's partisanship that he fails to mention some of its most significant aspects. To open the eyes of modern readers to the full meaning of the "Vision" in its own time, he might well have remarked that Cowley's description of the temper and methods of a tyrant implies a confident hope, then widespread, that the Stuarts would reign in the spirit of constitutional liberty. Though Cowley exaggerated the faults of Cromwell, his philippic is of permanent value as a fervid warning against that forceful and unscrupulous type of personality which is nowadays termed the superman, and by which nations recurrently allow themselves to be fascinated and enslaved.

To the Riverside Literature series (Houghton Mifflin; 25 cents) has been added "Selections from American Poetry," by Dr. Frederick H. Law; shorter poems of Longfellow, Whittier, Poe, Lowell, Bryant, Emerson, Holmes, and Whitman, a half-dozen more or less to each, together with the necessary editorial matter.

GRAMMAR, ELOCUTION AND DEBATING.

A revised edition has appeared of Ella M. Boyce's "Enunciation and Articulation" (Ginn; 30 cents). Word lists and illustrated exercises make up the bulk of the volume. One would suppose that teachers might welcome phonetic descriptions somewhat more detailed than those provided. A list of words commonly mispronounced is appended. It is not always perfectly trustworthy. We hope, at least, that no one will accept its recommendation to pronounce "stomacher" with a "k."

"Teaching to Read," by Nellie E. Turner (American Book Company), does not concern itself directly with the work of the primary grades. It offers a methodology for teachers, and by means of elaborate question and answer dissects a great many very ingeniously selected passages, with a view to making clear such elocutionary matters as grouping, contrast, parenthesis, repetition. But teachers of reading anywhere will find it suggestive; it offers an effective club to drive "THE cat and THE dog" from our schools.

Another book composed for the teacher is Prof. Paul Klapper's "The Teaching of English" (Appleton; \$1.25 net). In a series of chapters written in the tone of straightforward classroom lecturing, in which occasional split infinitives do not seem particularly shocking, the teacher is taught strategy useful in the long battle of the double negative; she learns how to provide the child with something to write about, how to stir his imagination by furnishing him with models above his level in tone; how to teach him to spell, and many other things. Much of this, no doubt, a good teacher knows already, but even such a one may well find the formulation of it useful.

Much of the matter in William Horton Foster's little book, "Debating for Boys" (Sturgis & Walton; \$1 net), first appeared in a magazine for Boy Scouts. In its present form, it should interest new readers. It does not attempt an over-simplification of the serious business that genuine debating is, but the author has a knack of putting things concretely that enables him to discuss "terms" and "issues" and "clash of arguments" in a way to be comprehended of youthful minds. He writes of even the tests of evidence without darkening counsel. He lays stress upon fairness, presents by means of a narrative the proper procedure for organizing a society, gives a summary of parliamentary rules, and furnishes in appendices a long list of questions for debate, hints on how to judge a debate, and a model constitution for a boys' debating club. The chapter on The Ford Hall Town Meeting seems out of place in a book for boys.

MODERN LANGUAGES.

FRENCH.

Allen and Schoell's "French Life" (Holt) is a first-year reader comprising over fifty French sketches averaging a little more than a page in length, a few dialogues, sets of questions on the subject-matter, and answers from which the student is to work back to the questions, and a vocabulary. The sketches, which treat of a variety of practical matters, such as the house, garden, city, schoolroom, modern inventions, newspaper, weather, etc., have in general been skilfully composed, and considerable care has been taken in interrelating them as to subject-matter, vocabulary, and idioms.

"Le Premier Livre," an attractive beginners' book suitable for preparatory-school work, has been prepared by A. A. and B. Méras (American Book Co.; 64 cents). Designed both as reader and grammar for the first half-year, it consists of sixty lessons, the reading portions of which are adapted from Malot's "Sans Famille," while the grammatical parts contain

the essential facts of grammar and paragraphs for drill in conversation and composition.

A prominent feature of Professor Olinsted's "Elementary French Grammar" (Holt) is an abundance of material for drill—grammatical questions to be answered in French, reading exercises, conversations, compositions, and oral exercises—appended to the lessons, of which there are forty-three. The grammatical material is grouped with good judgment, and careful choice of type aids the clearness of its presentation.

Racine's "Bérénice," edited with introduction and notes by R. E. Pellissier, is the latest addition to the Oxford French series (35 cents). This series is published by American scholars, under the general editorship of Professor Weeks. The introduction presents a clear account of the problem of the two Bérénices, prudently concluding that until new facts are brought to light it will not be solved.

"Les Boulinard," the amusing play by Ordonneau, Valabrègue and Kéroul, edited, with introduction, notes, questionnaire, exercises, and vocabulary, by F. G. Harriman, is a recent addition to Heath's Modern Language series (30 cents).

Dumas's "Vingt Ans Après" has been ably edited for Ginn (60 cents net), with notes and vocabulary, by O. B. Super.

The ballades of yester-year are studied industriously by Helen L. Cohen in a recent Columbia dissertation ("The Ballade"; Columbia University Press; \$1.75). The five chapters discuss the origin of the ballade, its fortune in France from 1400 to 1650, its treatment by French theorists of the same period, the Middle English ballade, and the recent revival of the form in France and England. Many ballades are printed in full, often from manuscripts or old editions: the volume has almost the look of a ballade anthology. The best chapter is that on the ballade in Middle English. Here the number of poems in question is so small as to permit individual study, and the resulting criticism is valuable. In the rest of the book very little-aside from the texts themselves-is really new. The later chapters, to be sure, offer slight chance for originality; but one might fairly expect, in a doctor's thesis, a fresh attempt to solve the difficult problem of the origin of the ballade, rather than a hesitant summary of conflicting opinions. The footnotes and bibliography are disfigured by the applying of the English system of capitalization to all foreign titles.

GERMAN.

M. H. Haertel's "German Reader for Beginners" (Ginn; 60 cents net) contains a singularly felicitous selection of fairy tales, those from Andersen and Grimm wisely modernized as to language, two by Baumbach and one by Mörike reprinted essentially in the original form. Besides these carefully graded pieces, there are a dozen well-known poems, mostly of a legendary character. Questions in German and narrative paragraphs for retranslation into German follow the texts. A further useful feature is a series of words upon which pupils may exercise their memory. The excellent vocabulary makes notes to the text unnecessary.

A manual for the teaching of German according to the direct method inevitably seems complicated, and its innumerable questions and answers, proper and natural in oral use, seem out of place in print. Examination of such a book is seldom cheering. It may be said, how. ever, of W. D. Zinnecker's "Deutsch für Anfänger" (Heath; \$1.25 net) that the material basis of the instruction is not uninteresting, that this material is thoroughly elaborated, and that a discreet use of English for explanation and translation encourages the teacher to modify his "directness" so far as may be expedient. An appendix contains a brief but clear chapter on German phonetics, a tabulation of grammatical forms, and sundry vocabularies.

The third issue of Calvin Thomas's edition of "Hermann und Dorothea" (Holt; 60 cents) is virtually a new book and is an excellent example of well-proportioned directness. The editor adopts Kullmer's identification of Pössneck in Thuringia as the little town from which Goethe derived the local color for the scene of his story. The historical antecedents of the plot are briefly set forth, and there are judicious remarks concerning the style and form of the epic. The notes and vocabulary leave nothing to be desired.

Prof. Arthur H. Palmer's edition of "Wilhelm Tell" has been entirely reset and revised, and is now put forth as a suitable text for secondary schools (Holt). Introduction, vocabulary, notes, and a new section of Fragen, prepared by Prof. Charles M. Furin, furnish a most serviceable apparatus for teacher and student alike.

Paul V. Bacon's "Vorwärts" (Allyn & Bacon) resembles the author's "Im Vaterland" in method and in general appearance, but is more elementary and, as a German reader for beginners, is more obviously graded. Systematic drill in the principal points of syntax is unobtrusively woven into the text, and equally systematic repetition of words and expressions, though it does not enliven the narrative, serves to fix essentials in mind. Enlivenment is sought rather in the actuality of the substance and the profusion of illustrations, many of which are evidently from original photographs. The book is unmistakably a skilful compilation.

"Herder and Klopstock," by Dr. F. H. Adler (Stechert; \$1), is a comparative study which aims to present in a new light the relations of these two notable forerunners of Germany's greatest literary period. The author shows how the new world of ideas created by Klopstock found sympathetic response in Herder, and how the latter, by his precept, vindicated the rights of imagination, of the Germanic spirit, and of that type of religion which is focussed on humanity rather than on theology. The last section of the book contains a more detailed and technical study of the poetic language of the two men. Dr. Adler is to be congratulated on his unflagging enthusiasm for his subject; there is never even the slightest intimation of the turgidity and pedantic heaviness which characterize the poetry of Klopstock and render it so utterly unenjoyable to most modern readers. The larger bearings of the subject-for instance, in connection with the Romanic Movement-are only cursorily indicated.

ITALIAN.

An Italian Dictionary. By Alfred Hoare. Cambridge: University Press; New York: G. P. Putnam's Sons.

The many readers who have long been baffled or disappointed by the existing Italian-English dictionaries will welcome Mr. Alfred Hoare's work. It is a strange and by no means a creditable fact, that while excellent dictionaries have been available for Englishspeaking students of French, Spanish, and German for half a century or more, Italian has been neglected. To say, therefore, that Mr. Hoare's is the best might not mean much "best" were construed relatively. But judged by any standard, it is an admirable lexicon.

Mr. Hoare's chief aim is to make it as practically useful as possible. With this in view, he resorts to many original devices. For instance, he endeavors to grade words according to the frequency with which they occur in the spoken or written language. He places first the commonest definition, next the rarer or dialect meaning, and finally the obsolete use. And to enable the reader to perceive at a glance these distinctions, he employs different fonts of type, as well as various symbols. It may require a day's practice to get used to these devices of his, but when they are once learned their reasonableness is recognized, and they save much time,

Mr. Hoare does not attempt to give all the words, living or dead, in the Italian language; but he does give those which the reader of either current books and newspapers or of the classical Italian authors is most likely to meet. Of course, there can never be an absolutely exact line drawn with any such classification, and no doubt each reader will look in vain in Mr. Hoare's Dictionary for words which he expected to find there. But on the whole the inclusions are very comprehensive, and the exclusions have generally a valid reason.

Among Mr. Hoare's points of excellence is the attention he has devoted to pronunciation. By the use of easily understood accents he makes clear, not only the syllabic emphasis of each word, but also the open and close sounds of e and of a and the two sounds of zz. His devices for indicating diminutives, augmentatives, etc., are clearly thought out. For a work in which compression is carried as far as possible without resulting in the puzzles which some etymologists put before us, this Dictionary quotes a considerable number of illustrative passages, Dante being naturally the chief authority cited.

Wherever we have tested the Dictionary we have found it satisfactory; and this is true also of the appendix, in which Mr. Hoare furnishes an English-Italian vocabulary, much briefer than the other part, but still sufficient for the needs of the average reader.

We regret that this work should not have been issued in a smaller format and at a price within reach of the purses of all those who would like to own it. The broad quarto page, with its clear type, is handsome, but an octave would have permitted the production of a volume more convenient and less exrensive.

Professor Grandgent's "Italian Grammar" (Heath; \$1 net), since its first appearance in 1887 facile princeps in its field, has undergone a thorough revision both by its author and by Prof. E. H. Wilkins, of Chicago, who has

provided a new set of forty-one exercises, a vocabulary, and a useful note on reading Italian verse, with examples from Pascoli and Carducci. The new exercises are a model of their kind, particular ingenuity being shown in the sentences, which not only aptly illustrate points of grammar, but are agreeably free from the artificiality and feebleness of sense that few compilers of grammars seem able to avoid. In its revised form this excellent book should long prove useful to students of Italian.

SPANISH.

The brothers Serafin and Joaquin Alvarez Quintero are among the best of contemporary Spanish playwrights. In editing their "Doña Clarines" and "Mañana de Sol" (Heath; 50 cents net), Prof. S. Griswold Morley has made available for American students two of the brightest playlets which have been produced recently in Madrid. The first of these, a comedy of character, has for its heroine a spinster who speaks the truth on all occasions regardless of consequence. To render so formidable a personage sympathetic and dignifled without losing an opportunity for comic effect demands delicacy of treatment; but the brothers Alvarez have succeeded in making the all too candid Doña Clarines as likable as she is disconcerting. "Mañana de Sol" is a charming little one-act idyl. It represents the meeting in old age of two former lovers. Like many other humorists, the Alvarez excel in pathos. Both these texts provide idiomatic Spanish, sufficiently simple to be used early in the course. The notes and vocabulary leave nothing to be desired.

BUSSIAN.

The study of Russian is still in its infancy both in England and America, so that no series of textbooks has been developed to meet the wants of students. The book that is best adapted to classroom use is the "Russian Conversation-Grammar" of Pietro Motti, a volume written by an Italian who was imperfectly acquainted with English and still more imperfectly with Russian; naturally it is crammed with mistakes. The "Russian Reader," composed for French students by Boyer and Speranski, on the basis of Tolstoy's tales for peasant children, and translated and adapted for English use by Professor Harper, is admirable in plan and, except for a few insignificant slips, in execution; nothing better of its own sort could be desired. But some elementary introduction to Russian grammar must be used with it. To supply such an introduction seems to have been the aim of Dr. Nevill Forbes in his newly published "Russian Grammar" (Oxford University Press; \$2), if one may judge from his own words in the preface:

The accompanying volume is a practical rather than a scientific grammar. It is intended for the use of those students who are working under a teacher able to explain the difficulties of the language to them, and also for the use of those who are working at the language by themselves with the object of being able to read it; but it does not profess to be an adequate means of teaching any one working alone how to speak Russian.

The book itself hardly corresponds to this statement of purpose. It is of the same general type as the familiar Latin grammars, such as that of Allen and Greenough, on which generations of American boys have of a Slavic philologist it is elementary; from that of a learner it is an advanced work, and, without a graded lesson-book to accompany it, a bewildering treatise. It aims to answer most of the practical questions that would occur to readers of modern Russian authors. Dr. Forbes can hardly be blamed that his book is less clear and logical in its arrangement and in its phrasing of rules than Latin grammars that have been continually revised. He deserves a severe rebuke, however, for not providing any index whatever; to make the volume thoroughly useful both a Russian and an English index would be required. This is no place for detailed criticism of Dr. Forbea's work. The reviewer has found a few statements that are mistaken, and many that seemed to him misleading or clumsy in expression; to be specific, the section on relative and interrogative pronouns is by no means adequate. But as a whole, the grammar is so far superior to any that has hitherto been published in English that cavilling criticism would be ungrateful. One may hope that Dr. Forbes will now proceed to construct a graded lessonbook that will replace that of the egregious Motti. If he should make it specially adapted as an introduction to the Boyer and Speranski reader, the gain would be even greater.

PERSIAN.

A brief introduction to the study of Persian. in German ("Persische Erzählungen, mit Grammatik und Glossar) by Georg Rosen, remodelled by Friedrich Rosen (Leipzig: Veit & Co.), has just appeared. It contains a capital little grammatical sketch, compressed into thirty-five pages. Each word in the original Persian characters is transliterated also into Roman letters. Then follow some fifty pages of short stories in prose for translation, accompanied by an excellent glossary; and appended at the end are a few brief selections from classic Persian poets. The beginning might have had further help through being given an inkling in a word or two as to the short stories that make up the body of the book; but the whole work serves as an admirable introduction to the language and does credit to its later editor, who is not only a Persian scholar but a diplomatist as well, for he is the Ambassador of the Imperial German Government to Spain.

GOVERNMENT AND ECONOMICS.

To those college teachers of political science who wish to put into the hands of their students a book that tells what our Government does as well as what it is the volume on "The New American Government and Its Work," by Prof. James T. Young, of the University of Pennsylvania (Macmillan), will make a special appeal. As a textbook it has several features which distinguish it from others of its kind. For one thing there is an uncommonly full discussion of the powers of Congress and of the ways in which these powers reach the citizen. Judicial decisions are cited profusely, the author's design being, as he states in the preface, "to lend more reality, vividness, and clarity to a subject that is already beset by too many generalities." The prominence given to these decisions is especially marked in the chapters devoted to Federal and State regulation of commerce. Another commendable feature of the book is its comprehensive treatment of State adminbeen brought up. From the point of view istration, a subject which too many surveys of American government have passed over without adequate presentation. Social legislation, likewise, and the whole economic side of governmental activity have received the emphasis which their growing interest and importance warrant.

On the other hand, there are some serious omissions. The book contains little or no historical discussion, nothing about the antecedents of American government. Most teachers of political science believe that their students should first leavn something about the way in which American government came to be before they plunge into the subject of what it is and does. More unfortunate still is the author's failure to include in the volume any consideration of municipal government in this country. That is an omission which surely should have had a word of explanation. In his endeavor to "picture the new government as it serves and helps the people" Dr. Young might well have drawn fine material from our municipal happenings of the last ten or fifteen years. The style of the book is clear and vigorous; there is no theorizing or chasing of political will-o'-the-wisps. It is hopeful in tone, yet never lapses into that shambling eloquence which too often mars the pages of such books. There are useful aids to teaching, including references for further reading and questions upon the text. The index, however, is ridiculously inadequate.

"An Introduction to the Economic History of England. I. The Middle Ages" (Macmillan; \$2.50 net), is the first volume of what promises to be a valuable book for students of English history. The author, E. Lipson, of Trinity College, Cambridge, has embodied in some five hundred closely printed pages the most recent investigations of scholars in regard to the rise and fall of the manorial system, the merchant and craft guilds, fairs and markets, the beginnings of England's foreign trade, and the main features of the English revenue and exchequer system. But he does more than merely summarize the researches of others. His pages are full of interesting concrete examples and quotations from mediæval statutes and political poems. Students will be grateful to him for the numerous footnotes in which he indicates the sources from which his examples are drawn. In dealing with controversial points he shows good judgment in the opinions which he adopts and fairness in his statement of the views which he rejects. He rightly recognises that most mediæval institutions are the result of complex factors and cannot be explained satisfactorily by a few brief formulas. Thus, as to the origin of the manor, he does not adopt exclusively either the Roman theory of Seebohm or the Teutonic view of Stubbs, but shows the probable influence of both Roman and Teuton factors. The chapter on the craft-guilds, over a hundred pages long, and perhaps the best in the book, gives a more rowy view of mediaval guilds than one usually finds. Incidentally the author sees a good deal of evidence of the activity of women in industry and trade. "There seems no adequate ground for the view that workingwomen were mainly 'unpaid domestic workers' following household occupations, rather than wage-earners supplying a market" (p. In the excellent chapter on "The Woollen Industry" he notes the appearance of the word "blanket" in a Pipe Roll of 1182. This is more than a century before the earliest date given in Murray's Dictionary, and long before the time of that Thomas Blanket, bail's of Bristel in 1340, who is popularly supposed to have given his name to a kind of woollen. Though entitled an "Introduction," this volume rather presupposes some knowledge of English history. It is more like the well-known economic histories of Ashley and of Cunningham than those of Gibbins and Cheyney.

HISTORY.

The four-volume "Riverside History of the United States" (Houghton Mifflin; \$1.25 net, each) meets, on the whole, better than any other work of equal compass now on the mar ket, the needs of readers who desire a comprehensive and well-written narrative, scholarly enough to command the respect of critics, and detailed enough to furnish particular information on important points, while at the same time sufficiently broad in scope and treatment to afford an intelligent view of the period as a whole. In such a work, novel content would be out of place; nevertheless, by emphasizing economic and social questions, State politics, and the development of the West more than was once customary, the authors have succeeded in giving freshness to the account of a number of episodes. There are differences both in manner and in success, of course, as is to be expected in a work by different hands. Professor Carl L. Becker, who writes on the "Beginning of the American People;" is more at home, apparently, on the side of the European influences which affected colonial development than he is on the side of colonial history itself: and his volume, though possessing exceptional literary merit, is not so notable in content. Prof. Allen Johnson's "Union and Democracy." on the other hand, carrying the narrative from the close of the Revolution to the beginning of Jackson's régime, is an admirable sketch of the establishment of Federal Government and administration, the formation of parties and the evolution of their policies, and the peculiar problems, sectional and local, of the early West. Prof. William E. Dodd, the editor of the series, who writes on "Expansion and Conflict," is at his best in treating the economics of slavery, State politics, and sectional issues. The last volume, by Prof. Frederic L. Paxson, entitled "The New Nation," offords a good view of the period since 1865, notwithstanding that it is weak on the constitutional side, and suggests rather than exposes the deeper foundations of contemporary politics. The reading lists appended to the several chapters show praiseworthy discrimination. Most of the maps, unfortunately, are so small and so poorly executed mechanically, as to make their use difficult: a fact the more to be regretted because the maps themselves represent much labor, and in themselves are both fresh and informing.

COLONIAL.

An excellent example of good work along somewhat technical historical lines is to be found in a monograph by Elmer Beecher Russell, entitled "The Review of Colonial Legislation by the King in Council" (Longmans, Green; \$1.75). The subject is not likely to be familiar to the average reader of Colonial history, but the prominent place that it occupies among the grievances presented in the Declaration of Independence, where it forms the basis of no less than eight

indictments, is sufficient to warrant careful investigation into its character and influence. Though Mr. Russell has not attempted to cover the entire field, he is to be congratulated on the thoroughness of his effort as far as he has gone. He has presented in a detailed and well-organized fashion the results of much scholarly research among records that are only in part available in this country, and has made abundantly clear the general truth that in this respect, as in many others, the Colonists were more or less unconsciously resisting a policy that placed the royal prerogative and the commercial welfare of England ahead of their own political and economic development. How far such development was actually checked by the exercise of the royal right Mr. Russell has not attempted to discover, but he has gone far enough to indicate wherein the grievances of the Colonists lay. That the King deserved to be indicted for "tyranny" because of the exercise of this right is an. other question.

No small part of the contribution that Mr. Russell has made lies in his presentation of the reasons underlying the royal policy, a policy that appeared to British statesmen as fundamentally necessary for the Empire. That the Colonists should have construed this policy as a severe infringement on liberty seemed incomprehensible to the somewhat opaque British mind. Mr. Russell's essay is rather better written than the average doctor's dissertation, but it is marred here and there by certain usages that are incorrect. The terms "attorney and solicitor" and "attorney and solicitor-generals" are never used for the "attorney and solicitor-general" or the "attorney-general and solicitor-general": and the title "King's Counsel," here used as if it belonged exclusively to the standing counsel of the Board of Trade, shows that Mr. Russell is unfamiliar with the meaning of the letters K.C. or with the distinguishing British practice of "taking silk." We think, also, that the phrase "legislative review," as an abbreviation of the title of the monograph, is incorrect, in that the Privy Council has never been a legislative body and its acts, whether of review or otherwise. cannot be termed legislative. We call attention to these errors, for they are frequent throughout the work.

HISTORICAL COLLECTIONS.

Some years ago the Illinois State Historical Library wisely placed the editing of its Collections in the hands of a scholar who knows well the history of the Old West, and who can write about it with sympathy and clarity. Again Dr. Clarence W. Alvord (this time in collaboration with Professor Carter, of Miami University) has placed students of Western history under deep obligation for his excellent work in editing Volume X of these Collections (Springfield, 1915). The volume is entitled "The Critical Period, 1763-1765," and forms No. 1 of the British Series. It is the forerunner of four or five others, soon to appear, on the same subject. The documents here presented have been selected with care from the archives of the United States, Canada, England, and France. Those written in the French language are given in the original and also in English, the translations occupying the lower half of the page. As in other publications of the Illinois State Historiters, "fe tions of troductio which is The Br try, 1761 ing pha rich doc volume. the sam ber of t ciently 4 to supp graphics and has traits of and two the inde

al

cal Library, the papers are divided into chapters, "for the purpose of breaking up that tions of documents." There is a general introduction on "British Illinois, 1763-1778," which is followed by a special introduction on The British Occupation of the Illinois Country, 1763-1765," a useful study of an interesting phase of Illinois history illustrated by the rich documentary material contained in the volume. A similar study, presumably from the same hand, will be included in each number of the series. The annotations are sufficiently ample to elucidate obscure points and to supply necessary bibliographical and biographical data. The volume is well printed and has a charming view of Kaskaskia, portraits of Sir William Johnson and Gen. Gage, and two facsimile reproductions. Best of all. the index can be relied upon.

The seventh volume of the Proceedings of the Mississippi Valley Historical Association, printed by the Torch Press, is, on the whole, a very creditable publication. It contains at least two or three papers which will place it distinctly above mediocrity. Prof. James Alten James's consideration of "Some Phases of the History of the Northwest, 1783-1786," is especially worthy of note. It will not be surprising, however, if Dr. Clarence W. Alvord's Critical Analysis of the Work of Reuben Gold Thwaites" should attract more attention than any other paper printed in the volume. Many years before his lamented death in 1913, Dr. Thwaites had earned a national reputation as an earnest and energetic worker in the field of Western history. He not only built up a great historical society and library, but by his unbounded enthusiasm and genius for organization did more than any other man to popularize and make possible the serious study of history in the Middle West. As a writer and as an editor of source materials, Dr. Thwaites was most prolific. In a period embracing somewhat more than a quarter of a century he wrote fifteen books, and edited and published about one hundred and sixtyeight volumes. The task which Professor Alvord undertakes to accomplish is fairly to appraise this remarkable output; in short, to establish, if possible, Dr. Thwaites's standing as an historian. Dr. Thwaites was not a great historian, and produced no work which will find a place with the best historical writing. Mr. Alvord has performed a rather delicate task in a becoming manner, and with the sure touch of one who knows his subject well. Fortunately, Dr. Thwaites accomplished so much in addition to his literary labors, and was so lovable a character, that he will long be remembered and honored.

The Proceedings of the Wisconsin Historical Society for 1914 (Madison, Wis.) contains Mr. Worthington C. Ford's address, "The Treaty of Ghent-and After." delivered at the regular annual meeting of the Society. As editor of the "Writings" of John Quincy Adams—a task which is still in the course of distinguished accomplishment—Mr. Ford can speak with authority on the subject of the Ghent treaty. His paper is notable for two reasons: it is a careful and illuminating study, and it is written with a lightness of touch that is almost sprightly. As was to be expected, he has made the best possible use of the personal incidents of his theme. Two other contributions to the volume are note-

to the Miami River" (1789-1790), edited with introduction and notes by Milo M. Quaife, and "A Semi-Historical Account of the War of the Winnebago and the Foxes," by Dr. Paul Radin, of the Geological Survey of Canada. Hay's "Journal," which Dr. Quaife has edited in a skilful manner, is both valuable and interesting. The journalist spent several months with the Indians and their French and British partisans on the site of the present city of Fort Wayne, Ind., and the "Journal" reflects, in varied details, the life of this old settlement as it was in the last decade of the eighteenth century. The legend recounted by Dr. Radin is printed in both English and Winnebago. Of local interest are Eben D. Pierce's account of James Reed, a Wisconsin pioneer. and J. H. A. Lacher's pleasing paper on "The Taverns and Stages of Early Wisconsin. Typographically, the volume is not creditable to the State Printer who produced it.

The most important paper in Volume XVIII of the Buffalo Historical Society Publications is an account of the peace congress at Niagara Falls, in 1914, by Frank H. Severance, the editor of the volume. While necessarily based mainly upon newspaper reports, the paper is as full and authoritative an account of what took place as is likely to be written until the various Governments concerned release their diplomatic correspondence on the subject. The texts of such documents as were made public at the time are included. Mr. Severance also contributes a sketch of Ephraim Douglass's peace mission to the Indians at Niagara, in 1783, together with a narrative of Brig.-Gen. Alexander Smith's spectacular performance on the Niagara frontier during the War of 1812. The latter includes letters hitherto unpublished. An interesting addition to the sources of American economic and social history is made in a translation, by H. F. DePuy, of this city, of "Le Pour et le Contre," a rare compilation by Louis Bridel, pastor of the French church at Basle, published at Paris in 1803. The work is especially valuable for its bearing upon the operations of the Holland Land Company in western New York.

The nineteenth volume of the University of Toronto Studies, being a "Review of Historical Publications Relating to Canada" covering the year 1914, is, as the title suggests, a collection of book reviews and notes, and these have been written by a wide range of authorities in their respective fields. book embraces nearly two hundred and fifty compact pages, comprising upwards of two hundred carefully written themes, varying in length from a few lines to several pages. The material is classified under six different headings, dealing respectively with Canada's relations to the Empire; the general history of Canada; local history, including the history of the various provinces; geography, economics, and statistics; anthropology, ethnology, and folklore; and education, ecclesiastical history, law, and bibliography. Somewhat more than half of the volume is devoted to history, provincial and local, geography, economics, and statistics. The publications reviewed are of a great variety, including books, essays, magazine articles, addresses, Government reports, etc. Although much of the material is chiefly of local interest, there are reviews of numerous volumes well known to all who are familiar with Canadian litworthy: "Henry Hay's Journal from Detroit erature, such as Shortt and Doughty's "Can- operation of which the technique has been

ada and Its Provinces: A History of the Canadian People and Their Institutions," Tupper's "Recoffections of Sixty Years in Canada," Douglas's "Lands Fortorn: A Story of an Expedition to Hearne's Coppormine River," and Bryce's "A Short History of the Canadian On the whole, it is fair to say that the book constitutes a reader's guide to Canadian literature for the year 1914, rather than a volume of literature in itself. The editorial work was performed by Prof. George M. Wrong, of the department of history in the University of Toronto, H. H. Langdon, librarian of the same institution, and W. Stewart Wallace, lecturer in history in Mc-Master University, Toronto.

PHILOSOPHY.

PSYCHOLOGY.

Prof. Charles H. Judd's "Psychology of High School Subjects" (Ginn; \$1.50) is less a formal treatise upon educational psychology than a critical summary and discussion from the point of view of the psychologist, of the views put forward by supposedly unpsychological persons interested in the teaching of special subjects. The book is thus on the whole a comprehensive and informing discussion of the issues involved in high school pedagogy, stimulating to the reader in spite of a monotony of style and a fondness for sentences in which "one" is followed by "he." On the other hand, it is a question whether the illumination afforded by "the psychologist"-as such-is sufficient to justify his magisterial tone. Surely no special powers are needed to tell us, for instance, that the tendency towards specialization is connected with the natural limitations of human attention. Nor are the reforms called for by Mr. Judd's special type of psychology altogether clear. Granting, for example, that words stand, not for passive associations, but for attitudes of behavior, what does this show but the fact, never forgotten by more discriminating teachers of language, that the meaning of words varies with persons and with situations? And when we learn that the difference between reflective and practical men, or, in Mr. Judd's terms, theoretical and practical men, is that the former are given to word-reactions, the latter to hand-reactions-a sad blow, by the way, to the practical pretensions of the commercial classes-we are compelled to wonder whether psychology has not taken wings and flown away. Apparently "the psychologist" is no longer able to distinguish between a word and a sound, between thinking and mere talking.

Like most psychologists, Mr. Judd appears to think that scientific insight is shown by viewing the mind as a machine-shop in which the several machines run independently of one another. Thus he is constant in warning teachers that (1) mere recognition of an object or mere skill in handling an object, (2) theoretical analysis, and (3) practical application are "different mental processes." Now it is true that the so-called mental processes of students often appear to illustrate this sort of independence-when, for example, a student who is supposed to have mastered the Pythagorean theorem is unable to lay out a tennis court. But the question is whether such practical disability is not a mark of superficial theoretical analysis. And, on the other hand, as against the traditional view that analytic consciousness deserts an

thoroughly mastered, which Mr. Judd accepts uncritically, we may suggest that the motorist who fails to retain a clear idea of how he controls his machine is doomed to destruction. It is at least as reasonable to suppose that the leisure to enjoy the landscape which comes to the practiced motorist is due to a larger "presence of mind," which enables him to keep in mind both the landscape and the machine, as to a transfer of mind from one object to the other. And so far as his skill is wholly unanalytic, one may ask whether it stands for any mental operation whatever.

The point has a broad application to educational theory. From the emphasis laid by the behavior psychologists upon "economy of thought," one must suppose that the purpose of education is to enable the student to get along with as little thinking as possible. Here he is to be trained in manual skill, there in practical application, and only upon special occasions is he to be trained in "analysis." Our query is whether the cultivation of a thoughtful and analytic doing of things is not the beginning and end of all education; and whether, again, this analytic attitude is not the one thing that makes all of the "different mental operations" mental.

And we may further ask whether this is not at bottom the real virtue of the plan of "generalization" which Mr. Judd offers as a remedy for the present confusion of aims in the high-school curriculum. It has been suggested by others that, as a foundation for courses in the sciences, we should have a general course in "science"; Mr. Judd proposes similar courses in mathematics, in which the boundaries of algebra and geometry are to be more or less disregarded, and in language. The idea seems a promising one. When scientific men contend for the sacredness of the boundaries of the sciences, it is proper to remind them that the sciences have been marked out, not by nature, but by man, for human convenience; and that for educational convenience-if a general course in science will afford at once a broader view and a deeper insight-these boundary lines may, if we like, be reconstructed or annulled. Yet it is permissible to ask whether the idea is quite as new as it is even reactionary. When Mr. Judd outlines his general course in language, on p. 245, one is reminded strongly of the traditional function of Latin.

"Psychology and Parenthood," by H. Addington Bruce (Dodd, Mead; \$1.25), is a book of 279 pages, filled with wide margins, interesting facts, good advice, and pleasant stories. It is always easy reading, and if ever interest wanes, appeal is made at the critical moment to the marvellous subconscious, with which the author has learned by long practice to conjure with great skill. Mr. Bruce holds that the environment is of much more importance in determining the child's character than is heredity; that unconscious suggestion has much greater influence upon him than the average parent supposes; that genius is the power to appropriate the remarkable resources of the subliminal, and hence is to a surprising degree capable of cultivation; that "intensive child culture" from the age of two or three upwards can often produce results commonly but mistakenly ascribed to extraordinary ability; and that life-long characteristics of

even nervous disorders, such as hysteria and phobias of various sorts, are often due to incidental suggestions, to slight physical disabilities, or even to mere habits originating in childhood-all of which may be easily avoided or overcome by proper care on the part of the parents. Though some of Mr. Bruce's conclusions are open to question, his book will be found valuable by many a parent for its excellent practical suggestions, based as they are upon a wide reading of recent psychological and medical literature.

No alterations occur in the eighth edition of William McDougall's "Introduction to Social Psychology" (John W. Luce & Co.), but there is added a supplementary chapter on sex instinct. Sex experience and conduct afford, the author thinks, the most obvious support of his main theory, viz., that human activities are to be traced back to a number of instinctive tendencies which manifest themselves independently of previous experience. He explains why he has not treated of sex instinct heretofore, largely, he says, by reason of the difficulty of so doing, in a book for the general reader. What the author states dogmatically, and without his usual recourse to the "perhaps" "not improbably," or the "doubtless" or "no doubt" (which mean there is some doubt), is generally acceptable enough, though not particularly startling. But when he goes on to refine and suggest, and to imagine hypothetical cases, in the manner of the philosopher or introspecting psychologist, that must be meant for the "general reader," who is credited, supposedly, with a liking for easy and interesting guesswork of the poetic order. One example will do for illustration: sex love should thus combine the most purely altruistic [?] with the most ruthlessly egoistic tendency of human nature . . . is [in the man] perhaps sufficiently accounted for by the fact that woman, especially at the age at which she is most strongly attractive to man. resembles in many respects, both mental and physical, the child, the normal object of the parental or protective impulse." Sex energy can be "long-circuited" and "sublimated" in "the service of intellectual, moral, and æsthetic development"; in the normal child, the sex instinct awakens at about the eighth year; but sex enlightenment in youth is dangerous, for "knowledge may be more dangerous than ignorance"; female coyness is essentially bashfulness on occasion of male approach and pursuit; and bashfulness "seems to be essentially the expression of a conflict between the opposed instincts of self-display and self-abasement"-these are samples of opinion and treatment. The author seems to attach a significance to sexual selection that some modern experiments appear to render unjustifiable. The style flows copiously and monotonously under the benignant imminence of an owlish gravity. Some of the pages are narrower than the rest by a quarter of an inch, giving the volume an unfinished appearance as one pages it over.

SOCIOLOGY.

To write a textbook on sociology is a particularly difficult task, partly because the subject is so new that it has as yet few formative traditions, and chiefly because the subject is so amorphous and so lacking in clear-cut outlines that every Outline of it

narrow or too vague. Profs. F. W. Blackmar and J. L. Gillin, whose "Outlines of Sociology" has just been published by the Macmillan Company (\$2 net), have tried to steer a safe course between these two dangers, and with some success. They have written a book which will give the student a fair idea of the entire field of sociology as it exists to-day. and they have not yielded to the temptation of wandering too far into the other social sci. ences. Whether they have even crossed the boundary line of these adjacent territories it would be impossible to say, inasmuch as boundary line there is none. The chief crit-icism to which the book lies open is less a criticism upon Messrs. Blackmar and Gillin than upon the nature of their chosen "sci. ence." Their book gives the reader a very excellent idea of sociology; and what is this idea? A rough analysis of this-as of any other good textbook on the subject-will show that sociology consists of two elements: the one, a valuable group of facts borrowed entire from various other studies, such as history, geography, economics, government, psychology, ethics, "comparative religion," etc.; the other, a group of generalizations and laws which sociologists have drawn from these facts. The two groups are of very different degrees of value. The first, although invariably intermingled, in sociological works, with a great mass of commonplace, does at least bring to the reader a good deal of important and fresh information-provided always that he has himself done no work in the various other sciences from which the information has been borrowed. The principal new knowledge to be derived from the second element, on the other hand-the generalizations and laws contributed by the science of sociology-consists very largely in the definition of various technical terms invented by the sociologists themselves. There are, for instance, in the book under review nearly ten chapters in which the average intelligent man or woman, hitherto innocent of sociology, will find practically nothing new, besides the definition and manipulation of a number of terms ending in ation. To the reviewer, at least, it seems plain that both sociology in general and Blackmar and Gillin's textbook in particular would be considerably improved if almost a third of their present contents were quietly deleted. For both the book and the "science" have value, that value consisting in the bringing together of wide groups of facts from varied fields, which, though they have instructive bearings on each other, are never actually placed side by side except in the works of the sociologists. From this point of view Professors Blackmar and Gillin have produced an excellent textbook, and one which deserves a wide use in college classes and by private students-provided, indeed, that sociology has to be studied

RELIGION.

In "The Doctrine of God in the Jewish Apocryphal and Apocalyptic Literature" (London: Hunter & Longhurst: 10 shillings net) Dr. Henry J. Wicks offers a valuable handbook for the study of the literature in question. He has gone critically through all the Jewish non-canonical books from the second century B. C. into the first century A. D. and tabulated their ideas, in chronological order as far as possible, concerning God's transcendence, jusability; and that life-long characteristics of clear-cut outlines that every Outline of it tice, and grace. His volume throws a welcome an undesirable nature, such as laziness, and is necessarily in danger of being either too light on a little-known but very important period o general

period of Jewish religious development. The general reader will doubtless be surprised to find so much similarity between the conceptions of the works here described and those of the New Testament. Wicks's volume, indeed, furnishes material for bridging over the gulf which has been largely held to separate the two Testaments.

Nothing helps better to clear up our conception of the significance of current religious ideas than such a sketch of their development as is given by Prof. A. C. McGiffert in "The Rise of Modern Religious Ideas" (Macmillan; \$1.50). After pointing out briefly the conditions that led to the religious disintegration of the seventeenth and eighteenth centuries, Dr. McGiffert discusses at greater length the procass of the reconstruction of faith as it is exhibited in the great philosophical works and the great scientific theories. He finds the general result of this movement to be the emancipation of religion from the crudities of the church creeds and its exaltation into the region of free and vital convictions. The volume may be recommended as giving an admirable picture of the higher religious thought of the last two or three centuries.

Alongside of the description of philosophical and scientific movements it is desirable to consider how far the religious beliefs of the Christian masses have been affected by the modern progress of knowledge. This question is treated by President-Emeritus George Harris, of Amherst College, in "A Century's Change in Religion" (Houghton Mifflin; \$1.25). Dr. Harris finds that, while interest in religion has not been diminished, there is a perceptible movement away from dogma towards spiritual conceptions. In the same line is Rev. Dr. Josiah Strong's "New World Religion" (Doubleday, Page; \$1.50), which finds the universal religion in Social Christianity, service to humanity under the guidance of the teaching of Christ. Both these volumes are characterized by reasonableness, reverence, and spiritu-

Among the significant developments of recent religious thought is the disposition in certain quarters to suggest modifications in the conception of the function of the church. In various ways stress is laid on the great work it may perform in the service of humanity by appealing to and fostering moral ideals in daily life. Thus, under the title "In the Service of the King" (Putnam; \$1.25), J. B. Dunn gives a "parson's story" of his not unsuccessful efforts to awaken the spirit of Jesus in the minds of persons not particularly gifted or in any way remarkable. Rev. E. S. Ames, in "The Higher Individualism" (Houghton Mifflin; \$1.10), points out the social nature of the individual, and the value of religious experience. W. H. Carnegie, Canon of Westminster, in "Democracy and Christian Doctrine" (Macmillan; \$1.25), shows how the church may encourage in all grades of life those social virtues that are essential to the permanence of a democratic society; in passing he says a good word for Russian religion. More distinctly P. M. Strayer, in "The Reconstruction of the Church" (Macmillan; \$1.50), affirms that the true function of the church is not to preach doctrine, but to teach and train men to love righteousness and to so about doing good. A hint of sympathy with this view may be discovered in J. S. Auerbach's "The Bible and Modern Life" be a vital part of the new course of study (Harper; 75 cents), which, however, is pri- in American high schools." When it is added Chemistry" (Allyn & Bacon), by Brownies

marily an exposition of the beauty of Old Testament poetry. It is a useful book notwithstanding some exaggerations.

For younger students of the Bible we have "The Songs, Hymns, and Prayers of the Old Testament" (Scribner; \$2.75), by Prof. C. F. Kent; "Geographic Influences in Old Testament Masterpieces" (Boston: Ginn; \$1), by Laura H. Wild; and "History of the Hebrews" (Scribner; \$1), by President F. K. Sanders. These are carefully written and trustworthy books. In contrast with these we may cite, as an example of extremely regrettable writing, "The Making of Christianity, an Exhibit of Hebrew and Christian Messianic Apocalyptical Philosophy and Literature" (Alton, Ill.: G. P. Clark; \$1.25), by Dr. John C. C. Clarke. By treating numbers as symbolical (a fruitful source of vain fancies) and by other discredited methods of interpretation the author constructs a "Hebrew Apocalyptic System" which he represents as the source of Christian ideas, and he has the extraordinary assertion (p. 14) that "no book in the Bible or in the world's literature has exercised or now exercises so immense an influence on human thought, study, and faith as St. John's Apocalypse." It is a misfortune for this interesting, but not mysterious, book to be made into an arsenal of predictions and other cryptic utterances.

SCIENCE.

MATHEMATICS.

The "Elementary Algebra" (Allyn & Bacon; \$1 net), by Professors Slaught and Lennes, is an attempt by ripe mathematical scholars to cover the work of the first year in algebra, with due regard to simplicity, the need of plenty of carefully graded exercises, the requirements of college entrance, the traditional order of topics, and the desirability of frequent reviews. The value of the book is enhanced by the device of marking parts to be omitted, without loss of continuity, by any who may desire a shorter course. Another commendable feature is the presence of good portraits of well-known mathematicians, along with some account of them. The pupil will not have to unlearn what he is taught by this book, but it seems a pity that the teaching should take so many pages.

In Reeve and Schorling's "A Review of High-School Mathematics" (University of Chicago Press; 40 cents) we have 64 carefully prepared pages designed for use by pupil and teacher in reviewing the algebra and geometry presented in a three-year highschool course. There are appended some useful suggestions respecting what is called "A Tentative Minimum Course in First-Year Mathematics" and kindred matters.

A glance over the pages of Breslich's "First-Year Mathematics for Secondary Schools" (University of Chicago Press) is sufficient to confirm the encomium passed upon it by the editors of the series of which it forms a part. After indicating both the purposes held in view and the great pains devoted to the carrying out of those purposes in the most effective way, they close their preface with the expression of the conviction that "this new book will contribute to the solution of the problems which confront the mathematical sciences in their efforts to

that the editors who sign the preface are Profs. Eliakim H. Moore, George W. Myers, and Charles H. Judd, it might be natural to remark that their praise needs no confirmation; but what we have in mind is the attractiveness of the arrangement, the variety and judiciousness of the illustrative examples, the pleasing typographical appearance, and other features which are easily perceived in turning the pages. One unessential but yet valuable feature is the portraits of illustrious mathematicians, with biographical sketches, interspersed through the volume. A general purpose running through the whole is that of using experimental or inductive geometry as a stepping-stone to the deductive science. In the circumstance that an American mathematician of the preëminent rank of Professor Moore has taken so keen an interest in the pedagogical aspect of his profession-it is to his presidential address before the American Mathematical Society in 1903 that the impulse towards this change in mathematical teaching in the schools is largely due-there is to be found a parallel to the similar activities of Professor Klein, one of the foremost of German mathematicians.

Robbins's "New Plane Geometry" (American Book Co.) is physically and typographically good. Scientifically, didactically, and stylistically it is rather commonplace. It begins by telling the reader that measurement is the concern of the science. A host of old definitions are given that play no rôle in subsequent argument. Vertex is defined in terms of vertex. The obsolete conception of axiom is present, as is also the old false statement as to the relation of whole and part. We are told that a magnitude may be "displaced" by its equal in any process, and that a postulate is "something required to be done." On page 8 we learn that a theorem requires proof, but on page 20 we are told that the most converse theorems are false. Two definitions of limit are given (pp. 96 and 97). Neither of them is in good use. Like any other textbook of geometry, this one contains many statements that are at once correct and clear, and it is rich in ex-

Palmer and Taylor's "Plane Geometry" (Scott, Foresman; 80 cents), edited by Dr. Myers, is commendable for its subordination of nice logical considerations to teachableness, for its mingling of nicely graded useful applications with an abundance of abstract exercises, and for its perspective, more important and less important matters being presented as such. It is a pleasure to note a similar avoidance of too much logical refinement in the "Plane Geometry" (Holt), by Messrs. Young and Schwartz. Other notable features of this book are the use of two colors in most of the figures, the presence of trigonometric ideas, and the employment of the notion of symmetry in demonstrations. The "School Algebra" (Holt), by Messrs. Rietz, Crathorne, and Taylor, is another illustration of the fact that the rising generation is being well supplied with elementary textbooks by competent scholars. This excellent book, designed to cover the first-year course in the subject, will be followed by a more advanced work by the same authors.

CHEMISTRY.

A revised edition of "First Principles of

and others, has just been issued, eight years after the appearance of the first printing. The revision has resulted in the rewording of some paragraphs, more extended treatment of a few topics-those of nomenclature and calculations especially-and the addition of two chapters on chemical equilibrium and on radioactivity. A new feature of this edition is the inclusion of the portraits of twenty distinguished chemists and well-known discoverers, accompanied by brief biographical notices. The bulk of the book has been increased, altogether, by 107 pages, bringing it up to a total of 526 pages, and making it a rather formidable text for the high-school pupil. The general excellence of the first edition was marred by a number of minor errors, most, if not all, of which persist in the revision. For instance: matter is still defined, three times over, simply as anything that occupies space, with no mention of the far more important general property of weightthough this is, of course, the basis of the discussions of the fundamental laws and of the calculations. Proust's law of definite proportions is still attributed to Dalton; the gram-molecular volume of gases is still given as 22.2, instead of 22.4; and the reaction of steam on copper with production of hydrogen is retained in two separate discussions of reversible reactions. That such mistakes as these have escaped the attention of the authors and, presumably, of most of the many teachers who have used this book. seems to indicate a discouraging lack of scientific acumen on the part of a large number of teachers of chemistry in the high

"Chemical Calculations" (D. Van Nostrand & Co.; \$2 net), by R. Harman Ashley, is a well-made book of 276 pages containing a fairly complete discussion of the chief applications of arithmetic and algebra in chemistry. Its distinguishing feature, and that which accounts for its unusual bulk, is the very large number of problems which are offered for exercise. Of these there are 516, besides many others which are worked out in illustration of the various types of calculation. There are no tables of logarithms, molecular weights, etc., and for most of the necessary data the reader is referred to Van Nostrand's Chemical Annual; the one notable exception being the tabulated information about aulphuric acid which occupies most of the brief Appendix.

"A Practical Elementary Chemistry" (Scribner), by B. W. McFarland, is written in the interests of a system of teaching which the author has practiced in the New Haven High School for about ten years and which "has certainly produced remarkable results." This method "is built entirely upon an exhaustive study of the laboratory work, not as illustrating the statements made in the descriptive text, but as the foundation of the whole subject." The book is divided into four parts: Laboratory Work, containing forty-seven Exercises in which a large number of well-chosen experiments are given: Fundamental Ideas, a brief summary of definitions, laws, and theories considered necessary for pupils who are not going to college; More Advanced Theory, supplying the additional material for college preparation, and Descriptive, about 200 pages of the usual descriptive text found in elementary chemistries. The work begins in the laboratory; with the accompanying recitations "Part II of the book is taken up, and very in-

tense drill is given on the meanings and uses of symbols, formulas, and equations." No lessons are assigned in the descriptive part, this being used only for reference in the preparation of written reports and exercises. In the recitations "the pupil is required to express himself very exactly, and with a speed that assures the teacher at once of the pupil's absolute mastery of the subject." One of the topics on which especial stress is laid is writing equations showing the seven different ways of forming the salts of oxygen acids, and "this drill should be so thorough that the pupil is enabled to complete the seven equations in one and one-half minute." "Modern ideas of efficiency are involved in every point of the course: i. e., how to get the desired results in the shortest time, with the least effort." The frequent recurrence of the word "drill" in the author's Suggestions to Teachers appears to indicate the keynote of his "system." markable results" in the form of letter-perfect recitations can undoubtedly be obtained by a competent drill-master by this or almost any other method; but whether the pupil gains the scientific point of view, which, after all, is the important thing, will depend in this method more than in others on the attitude of the teacher; the text will give little help in this direction. We cannot agree with the author that "This course puts into the hands of the pupil a book which is almost as good as a private teacher at his side." The book and the method seem reactionary, and recall Professor Barker's textbook published in 1870, in which the theoretical and the descriptive matter were in two separate, water-tight compartments, and the large type of the Theory was to be committed to memory. Some students of chemistry in the seventies will remember the book and the "remarkable results" which were obtained by it.

"Chemistry of Familiar Things" (Lippincott; \$1.75 net), by Samuel S. Sadtler, "has been written because of a demand for an insight into chemistry by those whose reading has been directed in other channels." The author feels that chemistry has hitherto appealed to few general readers, but he detects now "signs of an awakening as to the interesting possibility of science considered broadly, and there is no doubt in the mind of the writer that chemistry can furnish interesting subject-matter for general consideration." As a matter of fact, there has always been a wide popular interest in science, and books dealing with scientific subjects in a sufficiently simple manner and an attractive style have never failed to find a large audience. Such a book was Joyce's "Scientific Dialogues," written in 1800, and many readers remember the fascinating volumes of Tyndall "On Sound," "Heat," and "Light," as well as a number of other books which put the layman in touch with interesting facts and speculations in biology, geology, etc. In chemistry we have Liebig's extraordinarily popular "Familiar Letters on Chemistry," which appeared in 1844; Johnston's "Chemistry of Common Life," dating from 1854; "Religion and Chemistry," by Prof. J. P. Cooke (1864), and, to mention only one or two of the more recent publications in this field. Lassar-Cohn's "Chemistry in Daily Life" and Kennedy Duncan's books and magazine articles. This latest contribution to literature of science for the general reader, which begins with an enumeration of substances formed by insects, ranges from the chemistry of the earth's evolution to radium. Air, Water, Metals,

Rocks, Soil, Foods, Textiles, and Physiological Chemistry are treated at some length, while Fermentation, Soaps Lighting. Heating, Leather, Rubber, and Glass are also discussed A brief outline of elementary chemistry is given in the first chapter "to enable the reader to understand and appreciate the sequel." The book, as is seen from this list of titles, presents a large amount of information, most of which falls well enough under the head of chemistry. The author is a chemist of wide experience, and from this he draws a number of interesting and pertinent observations. Un. fortunately, the manner of presentation is not particularly attractive, and many sentences are so badly worded that they are vague or positively misleading. For example: The "elab. oration of chemicals from the fungi and bac. teria, such as alcohol and carbon dioxide from yeasts," etc. (The italics are ours.) "On a clear day the hot flue gases are very much lighter and the weight of the atmosphere pushing at the grate bars is notably greater than at the top of the chimney." "Expenditure of mechanical forces always results in a definite amount of heat." "For heat to move best in water or air, it must rise and circulate." One is in doubt in a number of in. stances whether the author really meant to say what he has printed: "It [the atom] is thought by some to be made up of electrical vibrations." "The more enlightened people vibrations." are, the more heat they need for comfort in countries that have winter." "Because a thing happens it can generally be explained." "It [dew] condenses on grass, leaves, and other objects, because of the greater prevalence of moisture close to the ground." "In winter the heated air of the houses is too dry, especially in the Northwest." He certainly did not intend to define celluloid as "a vulcanized fibre made by the action of zinc chloride on paper" (p. 27).

PHYSICS.

Prof. N. C. Riggs has revised and rewritten the well-known textbook "Hancock's Applied Mechanics for Engineers" (Macmillan; \$2.40). In this revised edition, the general treatment and arrangement have been retained. The most important changes to be noted are the transfer of the chapter on the dynamics of a rigid body to a later position, the increased use of graphical methods, and the addition of many new problems. The text was a popular one as it left the hands of Professor Hancock, and it has been improved in this edition.

Most of the books by Prof. Harry C. Jones are irritating to the reviewer for the reason that their good qualities are marred by carelessness of thought and style. This carelessness is particularly inexcusable in "Electrical Nature of Matter and Radioactivity," third edition (Van Nostrand; \$2 net). A book on such a topic which runs into three editions has, presumably, good qualities, and this popularity should have induced the author to correct misprints, mistakes in grammar, and false statements, and to revise with enough care to bring facts up to date. For example, on page 3 we find posivitely for positively; on pages 188 and 189, Allan for Allen; on page 23, "What we know is changes in energy": page 29, "The elements have their own . characteristic spectrum," and the statement following is not a sentence at all. As errors we may note the following: On page 20: "J. J. Thomson, to whom we owe the entire electron conception"; as a curious piece of rea-

proved and ener thesis of entity, a is quite not con there are 1909, the well kno been aln example, not men ian mov fessor M inadequa omission who has writer,

coning, Professor Jones states that Ostwald proved "Matter, then, is a pure hypothesis, and energy is the only reality," and yet the thesis of this book is that electricity is an entity, and, one would suppose, a reality. It is quite evident that Professor Jones does not consider recent work important, since there are only meagre notices of results since 1909, the date of the second edition. Now it is well known that parts of the subject have been almost entirely changed since then. For example, recent work on the positive rays is not mentioned, the discoveries on the Brownian movements are omitted, as is also Professor Millikan's work. The index is still quite inadequate, as a cursory glance shows many omissions. It is a pity that Professor Jones, who has many of the qualities of a good writer, should treat his readers with such lazy disrespect.

BIOLOGY.

A well-grounded complaint is frequently made that in all our schools too many subjects are taught, and that this congestion crowds out from the course very important old-fashioned matters, such as correct spelling, accurate mental arithmetic, sound geography, and the like. The head of the biological department in the DeWitt Clinton High School of New York city, Mr. George W. Hunter, has felt this want, and has endeavored to meet it by preparing a handbook which is made up of practical problems in simple applied science. ("A Civic Biology," by George William Hunter; American Book Co.). Mr. Hunter has availed himself of the cooperation of many of his associates and has constructed a synthetic manual of very wide range. Naturally, in a treatise made up, as this one is, of a myriad fragments taken from various sources, specialists can find errors. But in judging such a work, one must ask whether, on the whole, it serves its purpose without leading the pupil much astray, The author begins by showing the relations of plants and animals to their surroundings and then takes up in proper sequence their relations to one another, their appropriation of food, their reproduction, their diseases, the preservation of health, and the bearing of all this upon the best means of obtaining civic welfare. A careful perusal of the book shows comparatively few slips, and none of serious importance. The book is made for high-school pupils, but it can be read or seriously studied by all who wish to inform themselves as to the numberless points where modern biology touches civic betterment. It is a far cry from the simple plant-cell and its simple life to the ancestry of Jonathan Edwards and the doctrine of Mendelism, but the long path between them lies in this little book. A few of the illustrations need more explanatory text to make them plain.

ANTHROPOLOGY.

The work done last year by expeditions of the Smithsonian Institution was almost all of the regular collecting type, with, however, a gratifying increase of valuable observation in the field. This is a phase which must soon become of prime importance. Instead of forever adding to the great collections in museums, we need more than anything else careful, thorough observations on the life histories of organisms, on the embryology, the soft colors, and parts which change character in dried or spirit specimens. The most interesting title in the publication is

Panama-California Exposition, of the natural history of man. Among many separate exhibits is a series of life-sized direct casts showing human development from the ovum onward of the white American, the Indian, and the negro. These have required two years and a half of constant labor. The later series show fifteen stages, from a day or two after birth to the oldest persons who could be found. Long trips were made when trustworthy news of a centenarian was received. In the case of the earliest, it was necessary in some cases to locate a likely source and then to wait until the infant was born. Restorations of all the remains of primitive man and casts of types of all races of mankind complete this excellent contribution to a subject of the keenest interest to us all.

For more than fifteen years Prof. Charles M. Child has been engaged in original work connected with some of the most perplexing problems in the life of organisms. He has endeavored to study in the laboratory some matters which hitherto have been largely treated by speculation without experiment. In "Senescence and Rejuvenescence" (University of Chicago Press) he has fairly stated the more important speculations, and he shows the bearing of these upon the question of life in its wide sense. He touches lightly upon the vexed question of vitalism, a discussion which goes back to Aristotle, but which is always coming up in a fresh and unexpected guise, and he discusses the various substitutes for a vital principle which have been suggested. These theories are taken up without prejudice; each receives its proper value and is assigned to its proper place. This prepares the way for a lucid presentation of the Life-Cycle in general, and thus the reader is brought to the major topics of Senescence. growing old, and Rejuvenescence, growing young. Not all readers will feel wholly satisfied with the author's definition of growth or of individuation, but he has done about as well, perhaps, as any one could. Having laid these matters aside, he approaches his laboratory study of susceptibility in one of the lower animals, Planaria, which affords convenient material for experimentation. Here we are brought face to face with the marvel of reconstitution, and the associated matters of certain forms of reproduction. The part which nutrition, or the lack of it, plays in the life of the organism is dealt with experimentally and, on the whole, very satisfactorily. From his experiments, Professor Child concludes that senescence is associated with the productive and progressive phases, and rejuvenescence with the reductive and regressive phases of the life cycle. At first this appears paradoxical, but a carefu! examination of the reasoning which has led up to the conclusion shows that every step has been taken upon the solid footing of careful experimenting. Although this work is by a zoologist, it is plain that it is investigation by one who also knows plants well. The author is exceedingly modest in referring to his invasion of contiguous fields, but a candid student can see that he is sure of his ground. The volume is enriched by discriminating references to the literature of the subject placed at the end of the sections, and by a very copious index.

In "The Investigation of Mind in Animals"

author makes but little pretence at discussion or abstract theorizing. He limits him-self to the presentation of the modes of procedure employed by researchers in animal psychology. Still, there is sufficient comment to reveal the compiler's attitude and to enable the lay reader to compare the general methods and results of the chief workers in this field. In a recent article on evolution Professor Osborn's opening words are as follows: "In the last thirty years two biologies have been developing. The first is the biology of the garden, the seed pan, the incubator, and the breeding-pen. The second is the biology of the field zoölogist, of the field botanist, of the paleontologist." If "experimental cage" had been added to the first of these categories, the work of the present volume would there find its place. The seven chapters deal respectively with Protozoan Behavior. Retentiveness: Habit-Formation. Associative Memory and Sensory Discrimination, Instinct, Homing, Imitation, and The Evidence for Intelligence and for Ideas. A rapid review of the entire book leaves one with a decided feeling of disappointment. There is so little of certainty, after so enormous an amount of experimental research in a field which is of the greatest importance as leading up to an adequate understanding of our own psychology. These short quotations from the first chapter will illustrate the general vagueness to which I have reference: "There is, therefore, no clear proof of the occurrence of any phenomenon requiring for its explanation the presence of consciousness in the Protozoa. Nor is there any evidence to show that these simple creatures are able to profit by experience in any but the most transient manner. . . . Nevertheless, though the available evidence does not support a tropistic interpretation of the behavior of the Protozoa, it is by no means necessary to refuse it a subordinate place as presenting a more or less true account of certain phenomena when regarded in isolation. . . . To sum up, though the activities of unicellular organisms reveal no irrefragable proof of the presence of mind, a study of their conduct suffices to exhibit at least a fundamental resemblance to so-called 'intelligent' behavior." Upon so insecure a foundation one proceeds to the consideration of the psychology of higher animals with no great amount of credulity. The chapter on imitation is the best, and that on homing the least satisfactory. The fact that migration is not touched upon eliminates whatever of value might be found in the latter. This hopeless groping for some definite foothold is finally illustrated by this illuminating paragraph: "Reviewing our evidence, we may say that it is by no means disproved that animals are intelligent and have 'ideas,' but . . . no test as yet applied completely excludes the possibility that animal learning is anything more than a process of association on the preceptuo-motor level. The one point that clearly emerges is the need for new methods of inquiry." After this summary of controlled experiments, our minds turn with relief to Henri Fabre, and with renewed interest to Bergson.

To students of zoölogy, and especially of evolution, one of the most welcome contributions of the year will be "The Alligator and Its Allies" (Putnam; \$2.50 net), by Dr. Albert M. Reese. The publishers even express the illustrated account of the exhibits, at the (Putnam; 90 cents), by E. M. Smith, the the hope that it has an "assumed appeal for

the layman interested in natural history." But this can hardly be said to be the case, even in the first chapter, which treats of the biology of the alligator. The account is too categorical, too lacking in color and force of presentation, to be far removed from textbook diction. In its intended field it is admirable. Within a volume of convenient size we find the more important known facts concerning the biology, anatomy, and development of the American alligator. The author has made three trips to the Everglades and swamps of Florida in search of these reptiles and their nests. He has brought to bear the skill of an embryologist, and has carefully reviewed the literature of his thesis, and has not hesitated to draw upon this whenever it seemed worthy. The biology rests almost wholly on the author's own observations, and gives an excellent idea of the wild life of these creatures, their breeding habits, and economic value. Thirteen feet is apparently the maximum size, but, instead of being a creature of extremely slow growth, an alligator can attain a length of ten feet in as many years. The maternal care of the female for her offspring is somewhat discounted, although it is thought that she remains near, and when warned by the squeaking of the yet unhatched 'gatorlings, returns and uncovers the eggs, to enable the little fellows to escape from under the heavy weight of the nest débris. So great has been the slaughter of alligators in our Gulf States that thirteen years ago it was estimated that 80 per cent, had been exterminated. At present, although the demand for skins is greater than ever, no legislative action seems to have been taken. The destructive increase of cane rats and muskrats is, perhaps, due to the disappearance of these great reptiles. The detailed descriptions of the skeleton, and of the digestive, urogenital, respiratory, and vascular systems, and of the embryology are all the work of the author. The entire chapter on the musculature and part of that on the nervous system are translated from Bronn's "Thierreich." It was found very difficult to obtain the early stages of embryos, as these were well advanced, even at the moment of deposition of the eggs. Only by shooting laying alligators could these stages be obtained. The most regretted lack is the absence of all comparative comment, the phase of application which would have added so much to this research. An abundance of excellent drawings and photographs and a good bibliography and index give additional value and completeness to the book.

GROLOGY.

Would that some of the early fathers of the glacial theory-Playfair, Charpentier, Agassiz -could return to us for an inspection of Monograph LIII of the United States Geological Survey, on "The Plelocene of Indiana and Michigan and the History of the Great Lakes." by Leverett and Taylor, expert specialists both. The volume is a marvel of interpretation, summarizing the work of many years, and showing in great detail the features due to the glacial lobes that occupied the troughs of Lakes Erie, Huron, and Michigan, in so far as they overlapped on the intermediate States above named. The most significant features of the region are of two kinds; terminal moraines, formed during the ice retreat: and shore lines and outlet channels of proglacial lakes. The moraines are arranged in festoons around the retreating ice-lobe margins, in accordance with the principle announced by Chamberlin nearly forty years ago. The proglacial lakes resulted from the gentle northeastward slope of a considerable part of the district, which caused the retreating ice-lobes to obstruct the drainage of the surface that they evacuated. The ingenuity with which the history of the lakes and their changing outlets is deciphered is truly admirable.

"Mountains, their Origin, Growth, and Decay" (Van Nostrand; \$4) is the last work of the late Prof. James Geikie of the University of Edinburgh, whose death occurred last year. The volume deals, as the author says, "almost exclusively with the borderland of Geology and Geography"; it might be expected to lean more to the latter than to the former science, as it is dedicated to the Council of the Royal Scottish Geographical Society, but as a matter of fact it is much more taken up with geological problems of structure, deformation, and denudation, than with geographical problems of form and appearance; it thus illustrates once more how difficult it is for a geologist to cross the border which separates his wellmatured science from its much less matured neighbor. The book has twelve chapters: for some reason that is not apparent eleven of them are entitled Original or Tectonic Mountains, while only the final chapter has a new heading, Subsequent or Relict Mountains. The first two chapters are concerned with young volcanic cones and dissected volcanic cones: the third with pseudo-mountains such as moraines and sand dunes: the fourth and tenth chapters deal rather lightly with theories of deformation; chapters five to eight are occupied with the Alps; chapter nine with ancient, worn-down mountains of Europe; chapter eleven treats of ocean "deeps" as the converse of mountains; and chapter twelve of relict mountains, or those which are left in relief by the excavation of valleys beneath an even surface of any structure. The distinction here made between original and relict mountains is artificial; insufficient attention is given to the large and growing class of mountains that, partly worn down after their deformation, are then uplifted again and thus enter a new cycle of erosion. Curiously enough, glacial erosion, a highly important process in the sculpture of many lofty ranges, is hardly mentioned. The book contains nearly 80 fine photographic plates, many of which are insufficiently related to the text; 57 figures, a glossary of 15 pages, and a 9-page

GEOGRAPHY.

The third Annual Report of the Argentine Geographico-Military Institute, for 1914, indicates progress in several lines of work, from measurement of baselines and geodetic triangulation to the publication of completed map sheets. The far southern republic thus promises to contribute to the international map of the world on the scale of 1:1,000,000, on the plan of Penck of Berlin, as well as to furnish its own people with detailed maps of their country on scales of 1:100,000 and 1:25,000. A significant feature of the present report is a translation of a monograph by Haardt von Hartenthurn, of Vienna, on the organization of the topographical bureaus of the European countries.

An interesting and instructive work in Sir Charles Lucas's well-known series covering the historical geography of the British Dominions is the second part of Volume IV, en-

titled "Historical Geography of South Africa" (Oxford University Press), which embraces the period from 1895 to the outbreak of the present European war. An account of the political and social conditions of the South African Republic in 1895 is contained in the first chapter, in which the author shows that at the end of that year, the situation was such that "revolution was in the course of nature" Then follows a discussion of the Jameson Raid and of events leading up to the outbreak of the South African War. The latter receives a detailed and illuminating discussion in three chapters, occupying three hundred pages of the slightly less than five hundred pages of text proper. The last two chapters are devoted respectively to reconstruction and union, and a general summary. The text is interspersed with a considerable number of maps and drawings which lend an added in. terest for the reader, and there is, at the end of the volume, a bibliography, including the books and other publications relating to South Africa. The appendix contains the texts of the Pretoria and London Conventions of 1881 and 1884, the Middelburg Terms offered by Lord Kitchener to Gen. Botha of March, 1909 and the Terms of the Vereeniging Treaty of May 31, 1902. A table of the dates of the principal events in the later history of South Africa serves as a convenient guide to the student or general reader, both of whose interests seem to have been kept well in mind by the author.

A small book of 180 pages on "Studies in Carto-Bibliography," by Sir H. G. Fordham (Oxford University Press), contains a number of essays, reprinted from the transactions of various societies, and revised, as originally written, with enthusiasm in the fulness of knowledge, concerning early road-books, county maps, and atlases of Great Britain and France. It can appeal but little to the great body of readers, but it is a choice morsel for the antiquarian whose tastes lead him along highways and byways. Among its chapters are Index List of the Maps of Hertfordshire, 1579-1900, John Cary, Engraver, Mapseller, and Globe-maker, The Cartography of the Provinces of France, 1570-1757, Descriptive List of the Maps of the Great Level of the Fens, 1604-1900, and Specimens of Full and Abridged Descriptions of Maps of Various Dates. High praise is given to the printed catalogue of atlases issued by our Library of Congress. The book closes with a five-page bibliography and a six-page index.

BOTANY.

One of the laboratory handbooks which were introduced in 1901 has now, in its third revision, brought its subjects again quite up to "Methods in Plant Histology" (University of Chicago Press; \$2.25 net), by Charles J. Chamberlain, may be fairly said to have kept abreast of the times from the first. It is clear in its directions, and is sufficiently full to enable even the student who works by himself to become acquainted with the finer points in modern histological technique. Part one is devoted to a description of apparatus and other appliances, and to the approved methods of cutting and staining; part two gives, with sufficient details, directions for attacking special problems in the structure of the lower and the higher plants.

In 1838, J. C. Loudon published an illustrated work on the trees and shrubs of the British

Isles, which contained, in addition to its accurate descriptions, a large number of classical citations and much interesting folk-lore. Loudon's "Arboretum et Fruticetum Britannicum" had four volumes of text and four of admirable plates. Many of the plates gave the winterstate of the plants, thus enabling the landscape architect and the amateur planter to know how the elements at their command would look when they were stripped of their foliage. In short, the volumes were a treasure in city as well as in country houses, and they have maintained their popularity even down to the present day. But it is plain that such a treatise must require frequent revision to keep it abreast of the times. In place of such revisions there have been many attempts to construct treatises covering a part or a whole of the same ground. One of the latest is "Trees and Shrubs Hardy in the British Isles." by W. J. Bean, assistant curator Royal Botanic Gardens, Kew, two volumes (Dutton; \$15). The descriptions are arranged conveniently, the genera in alphabetical order, and likewise the species, placed under each genus. One hundred pages are devoted to plain directions concerning the care of woody plants and their selection for special localities. All of the advice is safe and sound, and may be unhesitatingly followed for our Eastern and Northern States. The volumes make a capital supplement to the older work of Loudon, bringing the specific descriptions down to the latest possible moment; they also contain a good account of the recent acquisitions from China. The plants newly introduced by Mr. Ernest Henry Wilson are described as far as has been possible, which fact gives to the work a high value for arboriculturists. It should be noted that the treatise is very conservative, but it is none the worse for that.

HORTICULTURE AND FARMING.

In "Continuous Bloom in America" (Scribner: \$2 net) Louise Shelton tells us where to sow annuals and perennials, how to lay out artistic beds with harmonious and symmetrical patterns, and furnishes cultural directions for a garden of continuous blooms from early spring to late autumn. Not the least important part of the book is the planting charts, by which one may visualize the effects sought after. These charts are facsimiles of successful plantings, but in attempting to follow the plans, says the author, "successful results will be at last obtained only when the gardener has learned the knack of crowding without detriment to the plants." The author also has advice for those who would specialize in spring and autumn displays. Her suggestions are practical, and she avoids technical language. There are numerous illustrations of famous American gardens.

Those of us whose school days date too far back to include the joys of "school gardens" and agricultural studies can recall our favorite "motion song" in the primary grade. It ran like this:

Shall I show you how the farmer Shall I show you how the farmer Shall I show you how the farmer Sows his barley and wheat?

With the response:

- O 'tis so, so, that the farmer O 'tis so, so, that the farmer O 'tis so, so, that the farmer Sows his barley and wheat.

As the books "for students who desire a practical working knowledge of the essentials of agriculture" pile up on the reviewer's desk, it seems to him as if all the agricultural college faculties were in line with "Shall I show you how the farmer?" The "so, so" of the farmer's activities is simply and completely set forth in Prof. Henry Jackson Waters's "Essentials of Agriculture" (Ginn; \$1.25 net). Beginning with a general chapter on The New Agriculture, the book proceeds to tell in detail how soil should be managed, its properties utilized, its fertility maintained, and how upon soils thus understood and handled profitable crops may be grown and im-proved stock raised. Particular information as to the various sorts of crops-small grains, fibre crops, grasses, legumes, forage crops, roots and tubers, sugar and tobacco, fruit-is given briefly but so definitely as to be of real value. Of course, the numerous pests of garden and orchard and the sprays that control them receive their share of attention. There are also two closing chapters of value on Business Aspects of Farming and Mechanical Power for the Farm. The appendix includes, besides several score cards, a practical spray schedule and table of common farm needs. Altogether, this is a plain, practical handbook, containing a remarkable amount of interesting and valuable farm lore.

NEUROLOGY.

In "Old Nerves for New" (Little, Brown), Mr. Arthur A. Carey deals with a subject of vital importance to most Americans, namely, the effect of the mental attitude upon the nervous system, and the relation of the mind to the body. He shows a method by which, with proper application, self-control can be achieved, beginning with simple physical movements for the relaxation of contracted nerves and muscles. With the power to relax, he asserts, comes the power to direct the physical and mental forces into channels leading to broader, more efficient, and happier living. He treats particularly of the effect of the emotions upon the health, gives suggestions for self-criticism, self-understanding, and self-correction, and advises how to help others to attain self-control. His discussions are at times lengthy; ey deal with such vital topics as love, hate, fear, selfishness, pride, and other emotions which strike to the roots of human nature. It is to be regretted that throughout the volume his sound reasoning and sometimes his scientific work are weakened by innumerable Scriptural allusions and quotations, for surely right thinking, right living, and freedom from what Christian Scientists call "error," and psychologists term self-hypnosis, should not be limited to Christians and Caucasians, but should belong to all humanity. But one must have all respect for the author's ardent desire to aid nervous sufferers and for the profound religious spirit of the work. The influence upon the author of the teachings of Annie Payson Call, to whom the book is dedicated, is manifest throughout. Could each of us but follow the suggestions Mr. Carey sets forth, and exchange the worn and dulled old nerves for bright new ones, the physical millennium would be near at hand.

LIP-READING.

Though lip-reading has been taught to deaf children for many years past, there have been comparatively few adults who have at- ply no special apparatus of thought.

tempted to learn it, perhaps because of the scarcity of teachers and the scant literature in the subject. It is with much satisfaction therefore that we call attention to a thorough and comprehensive volume by Martha E. Bruhn-"The Müller-Walle Method of Lip-Reading" (Lynn, Mass.: Thomas P. Nichols & Son; \$2). Miss Bruhn studied in Hamburg, under the man whose methods she has adapted to English. In the first chapter on the origin of instruction in lip-reading, she says that for those who lose their hearing after learning to speak, the external characteristics of speech are the essential points. In natural conversation, when lip movements are not exaggerated, the adult deaf person is able to grasp the meaning of a sentence as a whole without a slow pronunciation of each word. With the idea of making the acquisition of the ability to read lips as easy and quick as possible, thirty lessons are arranged, in each of which Miss Bruhn introduces some new sound or combination of sounds, makes suggestions for self-help by practice with a mirror, and furnishes a short story to be read to the deaf pupil. phrases give the story in a series of questions and answers, and introduce a variety of synonymous terms and colloquialisms in common use. The spirit of the book is admirable, and in its analysis of the points to be noted by deaf persons who desire to read the lips it is invaluable. It shows that lip-reading is an art to be acquired only by most patient perseverance, but that it may be achieved by all who practice diligently, according to the method described.

BUSINESS MANAGEMENT.

Prof. Hugo Münsterberg's "Business Psychology" (La Salle Extension University) opens with a lengthy sermon to the business man on the importance of consulting the expert psychologist, and closes with a reproduction of the not very striking discoveries recorded in his "Psychology and Business Efficiency." The rest of the book is filled with psychological commonplace, illustrated by reference to "the customer" and "the workman," where any other human being would serve as well, and with the commenplace of business experience. Surely no special training in psychology is needed to discover that (e. g.) a blue gown is set off by a yellow background, that the merchant must make himself as well as his goods pleasing to his customer, or that it is unwise to distract the attention of a customer who is about to decide in favor of certain goods. Altogether, the shrewd reader is likely to find the special illumination afforded by business psychology" in strange contrast to its sacerdotal pretensions, and to conclude that, in practical matters, psychology has little to say that might not be discovered by unspecialized intelligence. Professor Münsterberg points to the difference between the farmer's forecast of the weather and the scientific predictions of the weather reports. But the fact remains that the psychologist is (at least) as little able to forecast the commercial weather as any business man; and when it comes to deciding how a given individual will respond to a given offer, the psychologist can say as little as any one else. Professor Minsterberg's observations of the conditions of efficiency are often interesting, but they im-

Among the recent additions to a growing literature is "Advertising-Its Principles and Practice" (New York: The Ronald Press; \$4). The book is the work of four collaborators, Harry Tipper, Harry L. Hollingworth, George Burton Hotchkiss, and Frank Alvah Parsons. It is an indication of the completeness with which the subject is treated that of these four authors two are professional advertising men, one is a professor of psychology, and one the president of an art school. There can scarcely be an aspect of this vigorous business-or profession-which is not presented and analyzed in a manner not only satisfying to the expert, but most engaging to the ordinary reader. One encounters old friends among the many illustrations, which show the advertisements exactly as they are-with no names omitted as in some books in this field. And it is interesting to see the displays of the mightiest ad-

vertisers severely criticised, their errors plainly set before our eyes. Some of the pictures are excellent reproductions in color. One might look for a lack of unity where so many minds have joined in the task, but no such fault is to be found.

BIBLIOGRAPHY.

Although Axel Moth's "Technical Terms Used in Bibliographies and by the Book and Printing Trades" (Boston Book Company; \$2.25 net) possesses a value all its own, the purchaser should understand that the volume, one of the Useful Reference series, forms a supplement to F. K. Walter's "Abbreviations and Technical Terms Used in Book Catalogues and Bibliographies" (Boston, 1912). The compiler states in a brief prefatory note that the present publication is part of a more extensive work, as yet unpublished. With few

exceptions, we are informed, terms which have already found a place in Mr. Walter work have not been included. Mr. Moth has given us an excellent list of technical terms: those in English have the Danish, Dutch French, German, Italian, Spanish, and Swe. dish equivalents. The foreign terms are accompanied by English definitions. Those in Latin have been gathered by Mr. Walter, and they supplement the list appearing in his "Abbreviations and Technical Terms." Judged as a continuation of Mr. Walter's book-and it pretends to be nothing more-Mr. Moth's compilation is admirable. Not only will it be of service to the expert bibliographer and to those engaged in the printing trades, but it will likewise be a distinct aid to the col-lector of books in assisting him to solve the mysteries of catalogues and other publica. tions printed in languages with which he is wholly or in a large measure unfamiliar.

EXAMPLES IN ALGEBRA

By A. H. WHEELER, High School of Commerce, Worcester, Mass. Price 90 cents.

This book of examples is to be used with any high-school textbook. It contains ten thousand exercises of the most modern character, and supplies extra material to be used in connection with the textbook proper. The need for such a book is attested by the numerous failures in algebra by pupils who succeed in other subjects.

Simplicity is the keynote of the work. The book is full of "one-step-at-a-time" problems; it is carefully graded from problems; it is carefully graded from beginning to end; and it presents the most complete collection of examples, both in quantity and in scope, now available in the English language. At least one-third of the ten thousand examples consist of mental exercises.

The superiority of this book to the older collections is due, to some extent, to the following of the best and latest foreign practice.

foreign practice.

DO YOU READ

"At last a writer worthy to be mentioned in the same breath with Joseph Conrad as an interpreter of the sailor and the sea. . . . The author of 'The Lady Aft' is boldly individual. To those who prize that quality, Mr. Hallet should be the most precious discovery in American fiction of recent years."—Bosten Herald.

What Are We Fighting For

Conscription and the Common People

A terrific arraignment of modern British Statesmanship by an English author, appears in The Open Court Monthly Magazine for September—just out. To escape the British Censor this article was personally brought to America to find a publisher.

The author is an Englishman of Scotch descent. He was introduced to the editor of the Open Court by one of the most prominent professors in the University of Chicago.

This article is entitled Carlisle and the War. The article is published in the spirit of fair play.

FIRST YEAR COURSE IN GENERAL SCIENCE

By CLARA A. PEASE

High School, Hartford, Conn.

This text offers a concise but comprehensive view of science. It teaches first-year pupils the relation and interdependence of the commonly recognized sciences and prepares them for intelligent work in any science offered during their later years. A simple laboratory course closely connected with the text accompanies the book.

CHICAGO SCOTT, FORESMAN AND COMPANY

Timely Volumes of Interest to Thinking Readers

By DAVID JAYNE HILL, Former Ambassador to Germany. 12mo, cloth, \$1.25 net.

A handbook on the relationship of the citizen to the State which will be of special interest to all students, librarians, business men, lawyers, teachers, and clergymen. Dr. Hill's standing as an authority on international law and diplomatic history is proverbial, and in this book he incorporates much informing material that will go a long way toward the solution of many of the vexing problems now trying the leading men of

By Seven Eminent American Specialist Authors.

After the war—what? In this book one of the greatest groups of American authorities which could be gathered together discusses the probable effects of the European War upon the United States and the questions which we shall have to settle because of it.

By FELIX ADLER. \$1.50 net.

Primarily a work on social ethics giving the views of a great moral leader on the causes of the war and its effect upon civilization, the possibilities of international peace, the moral awakening of the wealthy, and the individual versus the state, etc.

Marriage and Divorce

By FELIX ADLER.

Dr. Adler's views on marriage, divorce, and the illusion and ideal of marriage, in which he shows how the divorce court may be avoided.

Emma Darwin: A Century of Family Letters

Edited by her daughter, Henrietta Litchfield. Two volumes. Illustrated. \$5.00 net.

The great scientist's early romance, domestic happiness, and religious difficulties described in hitherto unpublished volumes of correspondence. "One of the literary surprises of the year."—N. Y. Times.

New York's Part in History

By SHERMAN WILLIAMS, Chief of School Libraries Division, the University of the State of New York. With eight halftone illustrations and many maps. \$2.56 net.

This is a genuinely interesting account of the distinguished work which has been done within the State by some of New York's greatest citizens and shows the very important part of history which has been accomplished by the State of New York.

A History of Latin Literature

By MARCUS DIMSDALE, Professor, University of Cambridge, England. 12mo, cloth, \$2.00 net.

An illuminating history of Latin Literature, written to be of interest to the general reader and at the same time of studied accuracy for classroom use. Dr. Dimsdale has been for twenty-five years Classical Lecturer at Kings College, Cambridge, and his work bears the stamp of authority.

In Press for Immediate Publication

Introduction to the Study of Sociology
By EDWARD C. HAYES, Professor of Sociology in the University of Illinois. 8vo, cloth, \$2.50 net.

This work discusses in detail the practical social problems of to-day and shows clearly how the individual personality is shaped by the society of the school, the playground and the home, and how society is shaped by the co-operative endeavor of individuals. It is the only comprehensive work on sociology that leads up to and culminates in a treatment of the problems of education from the sociological point of view.

Newspaper Editing

By GRANT MILNOR HYDE, Author of "Newspaper Reporting and Correspondence." 12mo, cloth, \$1.50 net.

A textbook on journalism for the assistance of young newspaper workers who are learning the technique of their craft, and for use in classes of editing and headline-writing in schools of journalism. Every phase of the subject is discussed in detail with a view to its beipfulness and practical bearing upon the work of the novice in journalism.

Life Insurance

By SOLOMON S. HUEBNER, Professor of Insurance and Commerce, University of Pennsylvania. \$2.00 net.

A complete exposition of the principles of life insurance representing years of work by the author under the supervision of the National Association of Life Underwriters, Every phase of the subject is evered and much new material not usually found to be available to the general reader is included in the book.

Agricultural Commerce

By GROVER G. HUEBNER, Ph.D., Assistant Professor of Transportation and Commerce, Wharton School of Finance and Commerce, University of Pennsylvania. 12mo, cloth, \$2.00 nct.

The book is intended for use as a textbook in schools of commerce and agricultural colleges, and will be of great service to all merchants connected with the various exchanges; as well as to members of agricultural associations, and all farmers who wish to make a study of the best methods of sale for their products, and the best way of obtaining full market prices.
